Our Essence

Transforming People

We empower people to gain work ad life skills, transforming their lives, improving their employability and inspiring them to grow through lifelong learning

Vision

To be the leader and trusted lifelong partner in Continuing Education and Training

Mission

To provide learning that makes Every Worker a Better Worker, Every Job a Better Job, Every Company a Better Company

Our Values

People are our priority

- Respect and teamwork
- Listen to customer needs

Passion for our goals

- Passion for lifelong learning
- Transforming people through learning
- Heart and hunger to serve our customers

Performance is our business

- Deliver exceptional / sustainable value
- Unmatched choice for our people and customers

Table of Contents

Introduction to the Learner's Guide	1
Introduction to the Course	2
Course Objectives	3
LESSON 1: UNVEILING DEVOPS CULTURE AND PRACTICES	
Defining DevOps and its Role in Modern Software Development	8
Understanding the Pillars of DevOps: Collaboration, Automation, Measurement, and Sharing	12
Benefits of Implementing DevOps Practices for Efficient Delivery	13
LESSON 2: DEMYSTIFYING CONTINUOUS INTEGRATION AND CONTINUOUS DELIVERY	
Exploring the CI/CD Pipeline and its Components	14
Understanding the Importance of Automated Testing and Deployment	16
Implementing CI/CD with Tools: Jenkins, GitLab CI/CD	17
Learning Activity: CI/CD Pipeline using Jenkins	18
Leveraging Version Control for Collaboration and Consistency	21
LESSON 3: HANDS-ON CI/CD PIPELINE SETUP	
Learning Activity: Setting Up a Basic CI/CD Pipeline	24
Configuring Automated Testing, Build, and Deployment Stages	29
Implementing Version-controlled Infrastructure as Code	33
Best Practices for Designing Reliable and Efficient Pipelines	34

LESSON 4: TOOLS AND PRACTICES FOR CONTINUOUS MONITORING

Understanding the Importance of Continuous Monitoring	35
Exploring Monitoring Tools: Prometheus, Grafana, ELK Stack	36
Setting Up Monitoring Dashboards and Alerts	44
Monitoring Application Health, Performance, and Availability	49

LESSON 5: AUTOMATING DEPLOYMENT WITH INFRASTRUCTURE AS CODE (IAC)

Introduction to Infrastructure as Code (IaC) Principles	54
Learning Activity: Implementation of Git and GitHub	56
Automating Environment Provisioning and Scaling	60
Ensuring Consistency and Reproducibility in Deployments	62

LESSON 6: INTEGRATING SECURITY AND COMPLIANCE WITH CI/CD

Incorporating Security Practices into CI/CD Pipelines	64
Learning Activity: Implementing automated security checks and vulnerability scans.	66
Ensuring Compliance with Coding Standards and Best Practices	68
Securing Deployment Environments and Managing Secrets	69

LESSON 7: COLLABORATIVE CI/CD PIPELINE MANAGEMENT

Collaborative Exercise: Designing, Building, and Managing CI/CD Pipelines	70
Learning Activity: Creating CI Workflow Using GitHub Actions: A Step-By-Step Guide	70
Applying Best Practices for Testing, Deployment, and Monitoring	74
Integrating Security and Compliance Checks into the Pipeline	76

LESSON 8: CI/CD AND CONTINUOUS MONITORING SUCCESS STORIES

Analyzing real-world use cases of successful CI/CD and monitoring implementations.	77
Case Studies Showcasing the Benefits of Automated Deployment and Monitoring	78
Identifying Scenarios Where CI/CD and Monitoring Practices Excel	78
Learning Activity: CI/CD Pipeline using Excel:	78

LESSON 9: FUTURE OF DEVOPS: EMERGING TRENDS AND INNOVATIONS

Exploring Emerging Trends in DevOps: GitOps, NoOps, and AIOps	84
Recognizing the Influence of Cloud-Native Practices and AI in DevOps	86
Reflecting on the Future Landscape of DevOps Practices	86

INTRODUCTION TO THE COURSE

Overview

This Learner's Guide aimed to present the content and activities aligned to the Workforce Skills Qualification (WSQ) Offer Customised and Personalised Service module.

Target Audience

This course has been specifically designed for the learners with a background in the retail or transactional (over-the-counter) services industries. The course content and examples are thus slanted towards these sectors. If you are not from these sectors, please advise your trainers.

Assumed Skills and Knowledge

Assumed skills and knowledge means what we expect you to know and be able to do already, before you start the course. We assume you have:

- Basic knowledge of CI/CD
- Basic Knowledge of Github
- Basic knowledge of DevOps software setup

Course Objectives

At the end of this course, learners will be able to:

- Have the knowledge and application skills to proactively offer and promote service to customers.
- Be able to access and communicate detailed dish/product and service information sought by a diverse range of customers in order to make recommendations that meet customers' personal needs.

Course Components

Workshops	Final Assessment	
	Assessment Method	Duration
	Written Assessment	30 minutes
	Practical Assessment	150 minutes

Course Duration

Classroom Training	Final Assessment	Total
21 hours	3 hours	24 hours

Warm-Up and Introduction

Notes

“This Is Service” Icebreaker Activity

Choose 1 item which best represents what service is in the retail industry from a service provider perspective?

Share the following with your group and then the class:

1. Your name
2. Company you are from
3. What do you do at your workplace
4. Why did you choose that particular item to represent service in the retail sector

Module 1: Unveiling DevOps Culture and Practices

Defining DevOps and its role in modern software development

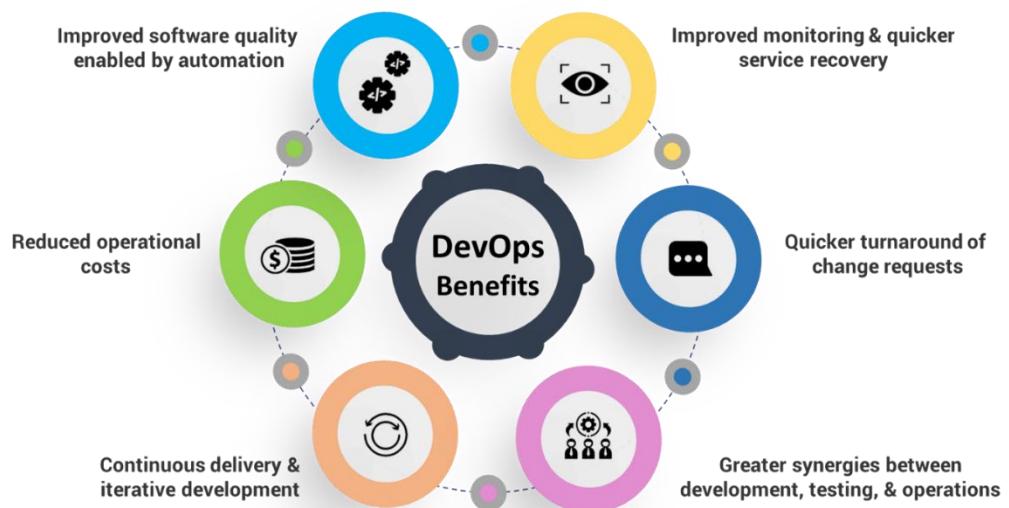

What is DevOps?

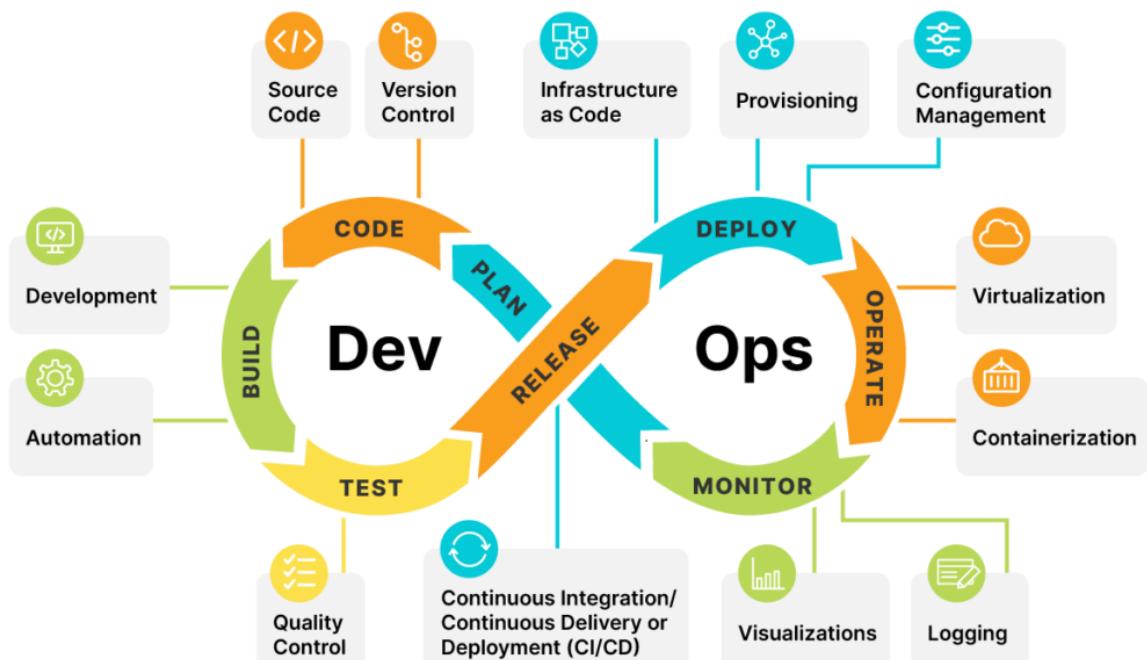

DevOps, short for Development and Operations, is a set of practices and cultural philosophies. That aims to bridge the gap between software development and IT Operation. DevOps brings together development, testing, deployment, and operations under one umbrella. That enables organizations to achieve continuous integration and continuous delivery (CI/CD) and maintain a rapid development pace.

- Enable rapid evolution of products or services
- Reduce risk, improve quality across the portfolio, and reduce costs
- DevOps integration targets product delivery, quality testing, feature development, and maintenance releases to improve reliability and security and faster development and deployment cycles.
- The adoption of DevOps is being driven by factors such as:
- Use of agile and other development processes and methodologies
- Demand for an increased rate of production releases from application and business stakeholders
- Wide availability of virtualized and cloud infrastructure from internal and external providers
- Increased usage of data center automation and configuration management tools

Why DevOps? – Delivery challenges

DevOps Lifecycle

Plan:

- During this phase, teams define project goals, gather requirements, and create a roadmap for development. Key activities in the planning phase contain requirement

gathering, scope definition, project estimation, and establishing project milestones and timelines.

Code:

- The developers will write the code and prepare it for the next phase during the coding stage. Developers will write code in accordance with the specifications outlined in the planning phase and will ensure that the code is created with the project's operations in mind.

Build:

- Code will be introduced to the project during the construction phase, and if necessary, the project will be rebuilt to accommodate the new code. This can be accomplished in a variety of ways, although GitHub or a comparable version control site is frequently used.
- The developer will request the addition of the code, which will then be reviewed as necessary. The request will be approved if the code is ready to be uploaded, and the code will be added to the project. Even when adding new features and addressing bugs, this method is effective.

Release:

- The release phase occurs when the code has been verified as ready for deployment and a last check for production readiness has been performed. The project will subsequently enter the deployment phase if it satisfies all requirements and has been thoroughly inspected for bugs and other problems.

Test:

- The testing phase is essential to ensure the quality and functionality of the software being developed. Rigorous testing is performed to identify and rectify any bugs, errors, or issues. This phase includes various testing types such as unit testing, integration testing, and system testing.

Deploy:

- The deployment phase involves releasing the software to the production environment for end-users to access and utilize. During this phase, deployment processes are automated to ensure consistency and reliability. Key activities in the deployment phase include environment setup, release coordination, deployment automation, and monitoring the deployment process.

Operate:

- The operation phase focuses on the ongoing management and maintenance of the software in the production environment. This phase involves monitoring the software's

performance, addressing user feedback, and handling any issues or incidents that arise. Continuous monitoring and feedback loops are established to ensure optimal software performance and user satisfaction.

Monitor:

- During the monitoring phase, product usage, as well as any feedback, issues, or possibilities for improvement, are recognized and documented.
- This information is then conveyed to the subsequent iteration to aid in the development process. This phase is essential for planning the next iteration and streamlining the pipeline's development process

Key Concepts of DevOps

- Agile Development
- Continuous Integration (CI)
- Continuous Delivery (CD)
- Infrastructure as Code (IaC)

Agile Development

Agile Development has become a cornerstone of successful software delivery. That enables organizations to respond quickly to changing market needs.

Agile Development focuses on iterative and incremental development. By embracing agile principles, organizations experience enhanced flexibility, improved transparency, and increased customer satisfaction.

Continuous Integration (CI)

Continuous Integration (CI) is a vital DevOps practice that aims to merge code changes from multiple developers into shared storage regularly. CI promotes early and frequent code integration. Even automated testing and immediate feedback

increase their popularity. By implementing CI, organizations reduce integration issues. With CI detecting defects earlier in the development process becomes easy. That improves collaboration among development teams.

Continuous Delivery (CD)

Continuous Delivery (CD) goes hand in hand with CI, enabling organizations to deliver software in a reliable and automated manner. The CD focuses on automating the entire release process, from building and testing to deployment and

production. With CD, organizations gain the ability to release software updates swiftly. With minimal manual intervention, and maintain a continuous flow of valuable features to end-users.

Infrastructure as Code (IaC)

A revolutionary concept in DevOps is Infrastructure as Code (IaC). IaC allows organizations to automate infrastructure setup and management, enabling reproducibility, scalability, and consistency across environments. While leveraging IaC tools and practices, organizations gain better control over their infrastructure, reduce human error, and achieve greater efficiency in software deployment.

Understanding the pillars of DevOps

1. **Culture:** Culture is the most important principle of DevOps. It refers to the set of principles, principles and practices that guide teamwork. Teams make decisions and focus on delivering value to customers in a DevOps culture. This culture fosters a sense of shared ownership and supports experimentation and innovation.
2. **Automation:** The second pillar of DevOps is automation. This is the term used to describe the automation of various software development, testing, deployment, and infrastructure management processes using tools and procedures. Teams can minimize errors, improve consistency, and increase productivity by automating these processes.
3. **Measurement:** The third pillar of DevOps is measurement. This means using statistics and data to monitor and improve performance. Teams can identify areas for improvement and make data-driven decisions by monitoring key performance indicators (KPIs). This makes it easier to ensure that everyone is working towards the same goals and things move forward.
4. **Sharing:** Sharing is the fourth pillar of DevOps. This means the knowledge, best practices, and resource sharing that takes place between teams. This way, teams can learn from each other's experiences and always work with the latest information.

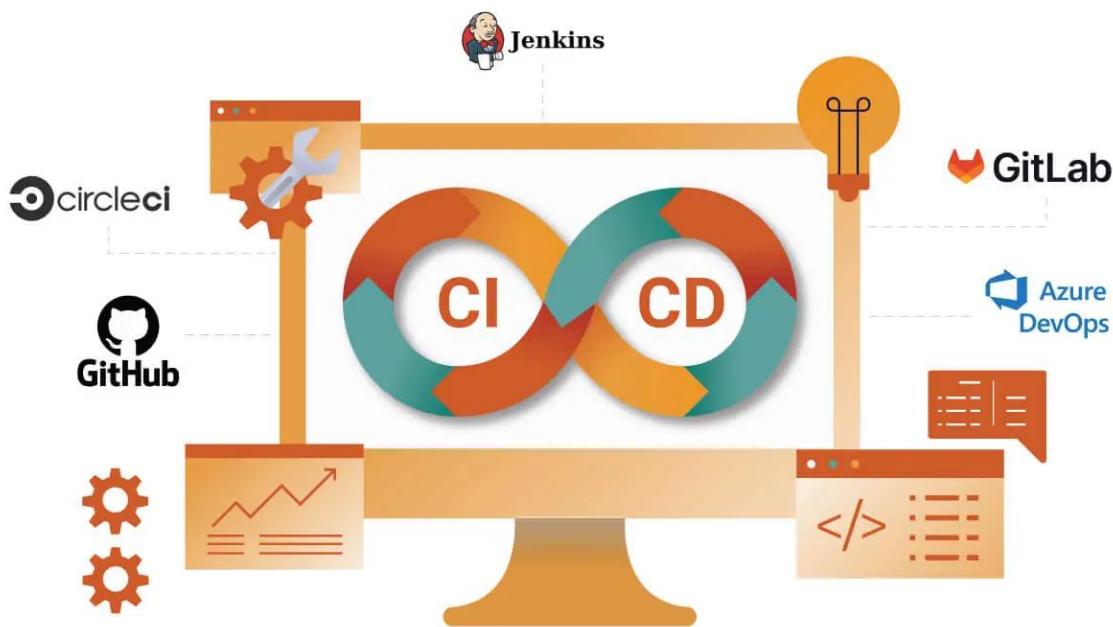

Benefits of Implementing DevOps Practices for Efficient Delivery

- 01** Agile project management.
- 02** Build a collaborative culture.
- 03** Build with the right tools.
- 04** Continuous integration and continuous delivery.
- 05** Shift left with CI/CD.
- 06** Monitor the right matrix.
- 07** Switch to microservices.
- 08** Implement automation.
- 09** Continuous Security.
- 10** Gather continuous feedback.

Module 2: Continuous Integration and Continuous Deployment (CI/CD) Concepts

CI/CD is a method that allows DevOps teams to deliver code updates frequently, reliably, and quickly using continuous integration (CI) and continuous delivery (CD) practices. CI/CD emphasizes automation throughout the development lifecycle (Build, Test, Deploy). By replacing the manual efforts of traditional development, code releases can happen more frequently, and with less bugs and security vulnerabilities.

Exploring the CI/CD Pipeline and its Components

What Is CI (Continuous Integration)?

Continuous integration integrates code changes into a shared repository of source code, and it usually automatically tests these changes as soon as they are committed. Continuous integration is performed as your developers write code, rather than afterward.

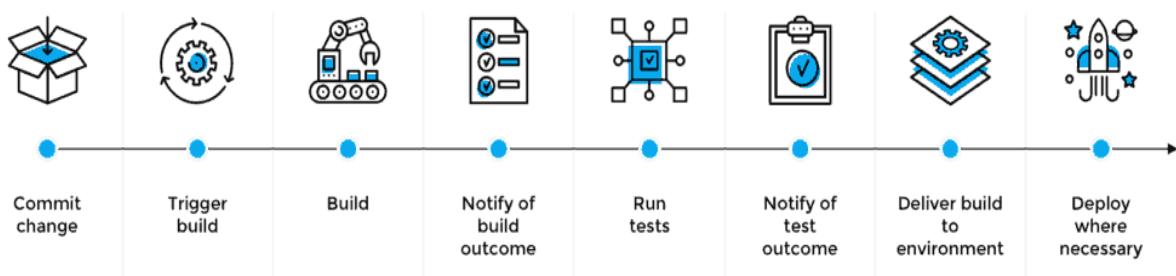

What Is CD (Continuous Delivery)?

Continuous delivery is an extension of continuous integration in which your team automatically deploys new code to a repository (such as GitHub). It can then be deployed to production at any time based on your needs and the needs of your clients. The added automation used by continuous delivery greatly reduces the amount of effort required to deploy code. With continuous delivery, you can respond more quickly to anything from changes in the market to security flaws.

The CI/CD Pipeline

- The CI/CD pipeline is the set of processes that drive your preferred combination of continuous integration, delivery and deployment, and it forms the base of your DevOps team's operations. In general, the head of your DevOps team is the one in charge of ensuring that the pipeline is working properly.

CI/CD Pipeline

Components of a CI/CD Pipeline

Every CI/CD pipeline will look different based on your team's specific needs and resources, but in general, they have four essential stages.

Build:

- In this stage, you pull your source code from a repository and build its components into a binary artifact. Your chosen integrated development environment (IDE) may help your developers automate this process.

Test:

- With the CI/CD pipeline, you want to employ as much continuous testing as possible. Unit Testing helps to verify that new features are working as intended, and most of your testing should be this type. Regression testing makes sure that new additions to your code won't break your existing infrastructure.

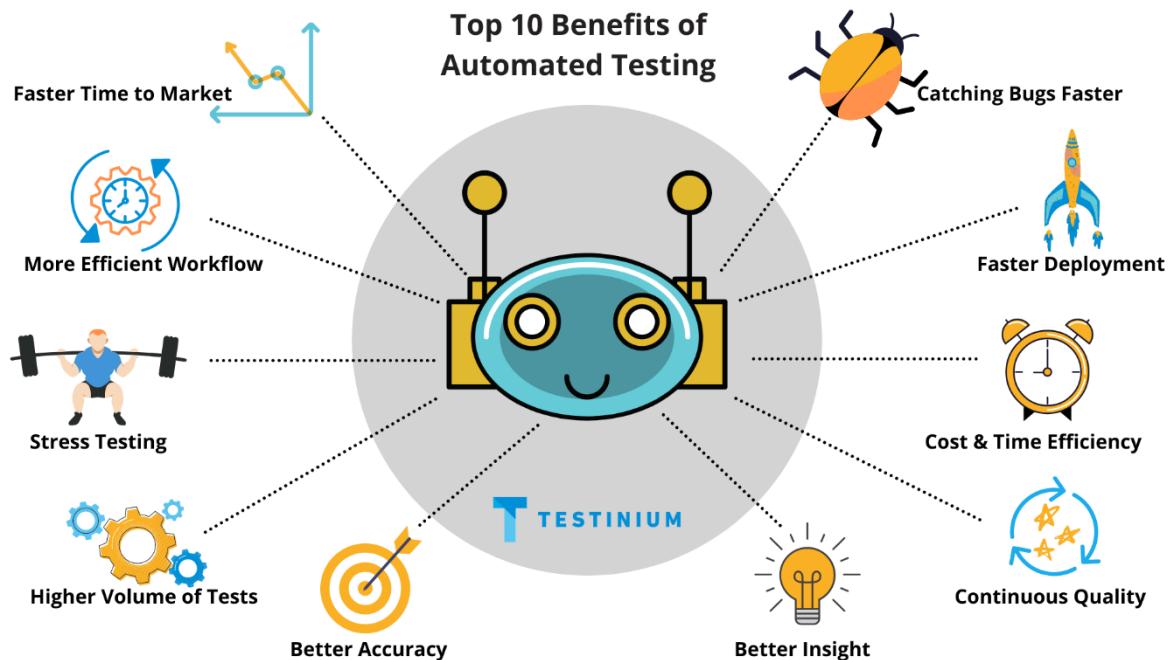

Delivery:

- After your tests are done, your developers' code should go to a staging environment. This enables you to perform A/B tests and find lingering problems, as well as letting your QA team know what they need to look at.

Deploy:

- Once your build has passed all automated testing, it can be deployed in production. With continuous delivery, the build is sent to a human for manual approval, while with continuous deployment the build is deployed automatically.

Understanding the Importance of Automated Testing and Deployment

Implementing CI/CD with tools like Jenkins, GitLab CI/CD

Jenkins

Jenkins

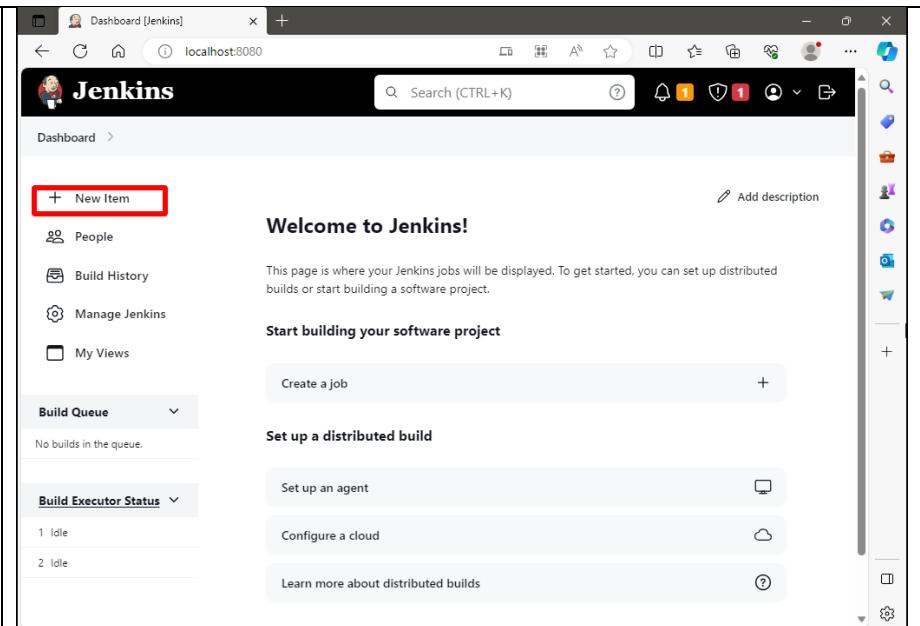

- Jenkins is an open-source automation server in which the central build and continuous integration process take place. It is a self-contained Java-based program with packages for Windows, macOS, and other Unix-like operating systems. With hundreds of plugins available, Jenkins supports building, deploying, and automating software development projects.

Jenkins key features:

- Easy installation and upgrade on various OSs
- Simple and user-friendly interface
- Extensible with huge community-contributed plugin resource
- Easy environment configuration in the user interface
- Supports distributed builds with master-slave architecture
- Build schedules based on expressions
- Supports shells and Windows command execution in pre-build steps
- Supports notification on the build status

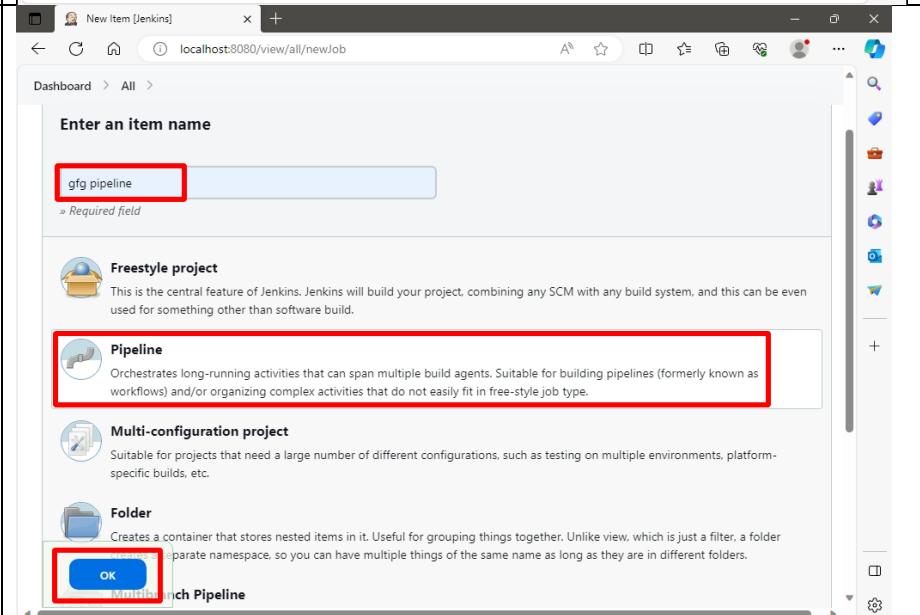

Learning Activity: CI/CD Pipeline using Jenkins

- To create a new project select the option available in the Dashboard which is “New Item”

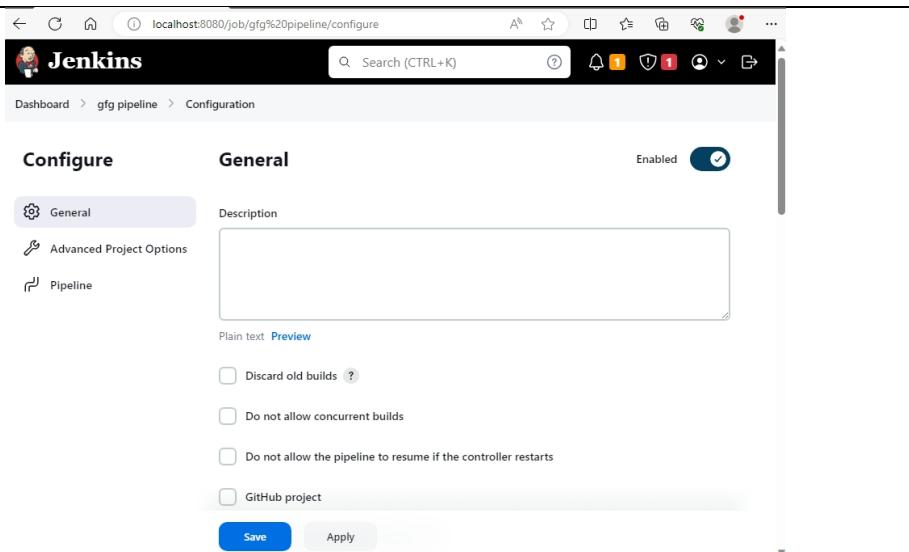

The screenshot shows the Jenkins dashboard at localhost:8080. The 'New Item' button in the top-left corner of the main content area is highlighted with a red box. The dashboard also features a 'Welcome to Jenkins!' message, navigation links like 'People', 'Build History', and 'Manage Jenkins', and sections for 'Create a job', 'Set up a distributed build', and 'Build Executor Status'.

- Now a list of options will be visible on the screen, along with a field to name the pipeline. Add a suitable name and select the “Pipeline” option to proceed.

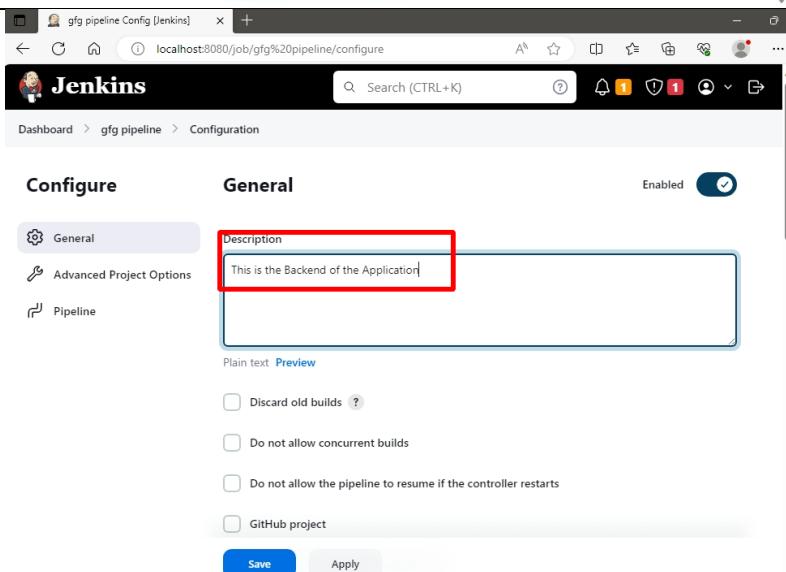

The screenshot shows the 'New Item' creation page at localhost:8080/view/all/newJob. A search bar contains 'gfg pipeline'. Below it, the 'Freestyle project' option is shown with its description. The 'Pipeline' option is highlighted with a red box. At the bottom, the 'OK' button is also highlighted with a red box.

3. Once redirected, the configuration page will appear.

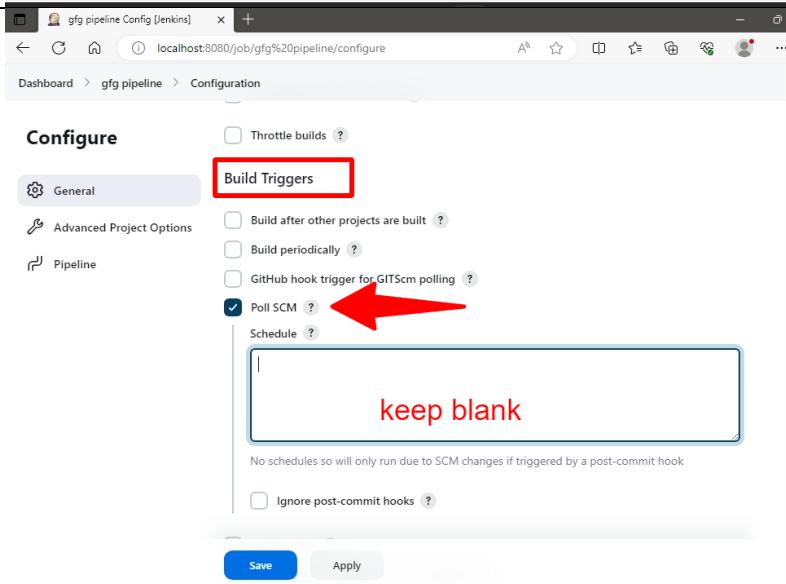

The screenshot shows the Jenkins Pipeline Configuration page. The 'General' tab is selected. The 'Enabled' toggle switch is turned on. The 'Description' field is empty. Below it are several checkboxes: 'Discard old builds', 'Do not allow concurrent builds', 'Do not allow the pipeline to resume if the controller restarts', and 'GitHub project'. At the bottom are 'Save' and 'Apply' buttons.

4. At first, there is the **General** section where the user can add a description based on the project for which the pipeline has to be created.

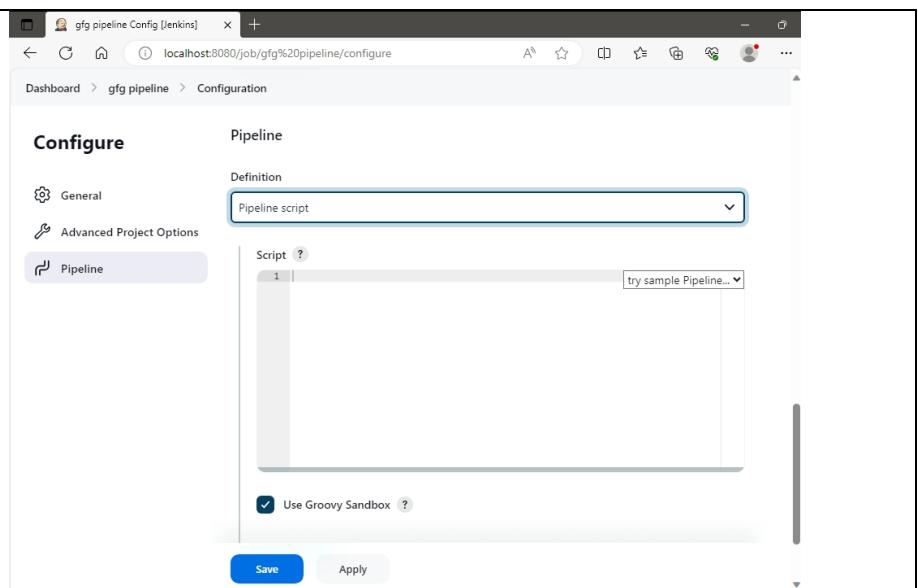

The screenshot shows the same Jenkins Pipeline Configuration page as above, but with a description added to the 'Description' field: 'This is the Backend of the Application'. This field is highlighted with a red box.

5. Now comes the second section, i.e. "**Build triggers**". Here, we need to specify the branch and repository and give the credentials too.

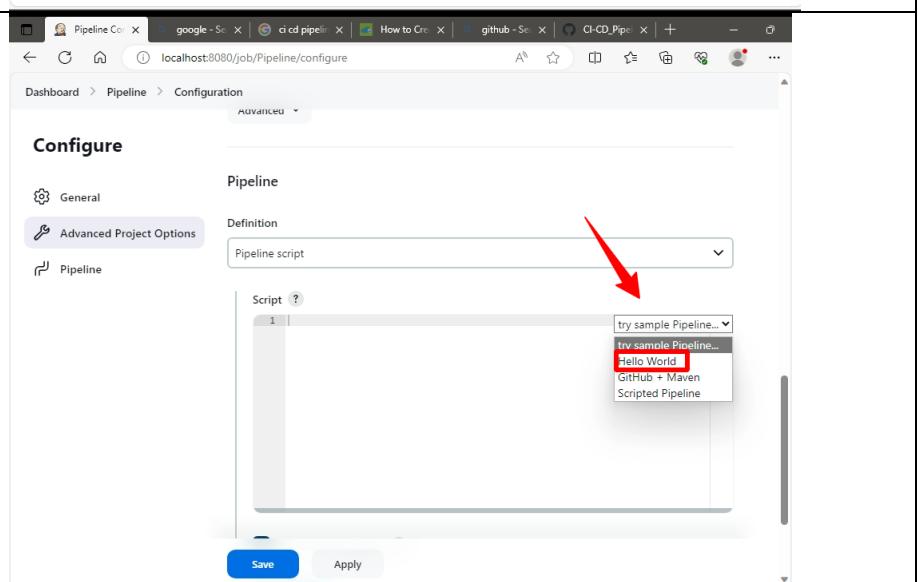

The screenshot shows the Jenkins Pipeline Configuration page with the 'Build Triggers' tab selected. The 'Poll SCM' checkbox is checked and highlighted with a red arrow. Below it is a 'Schedule' field containing the placeholder text 'keep blank'. Other trigger options like 'Throttle builds', 'Build after other projects are built', 'Build periodically', and 'GitHub hook trigger for GITScm polling' are also listed. At the bottom are 'Save' and 'Apply' buttons.

6. This is the last section i.e. “**Pipeline**”. Here the user specifies from where the scripts will be imported including the path to the file, repository, credentials, etc.

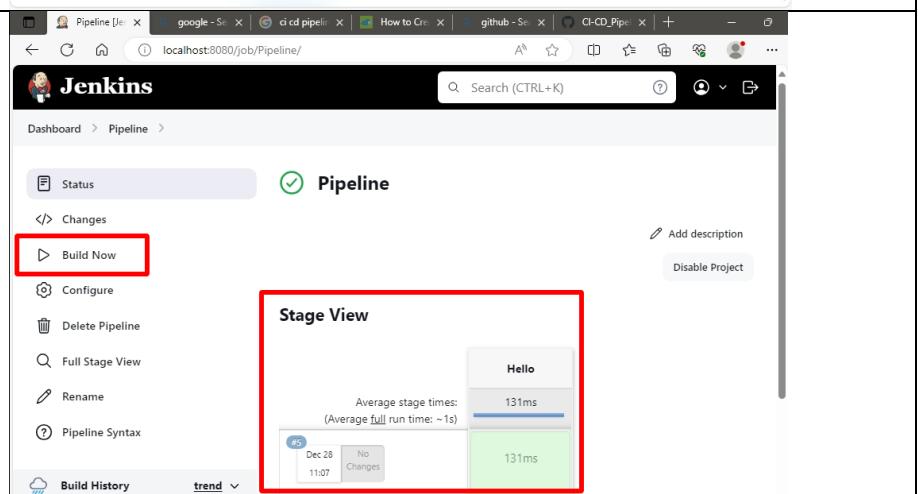

The screenshot shows the Jenkins Pipeline configuration page. On the left, there are tabs for General, Advanced Project Options, and Pipeline. The Pipeline tab is selected. In the center, there's a 'Definition' dropdown set to 'Pipeline script'. Below it is a 'Script' editor window containing a single line of code: '1 | try sample Pipeline...'. A checkbox for 'Use Groovy Sandbox' is checked. At the bottom are 'Save' and 'Apply' buttons.

7. Now click on **try sample Pipeline** and select **Hello World Script** and click on **Save**.

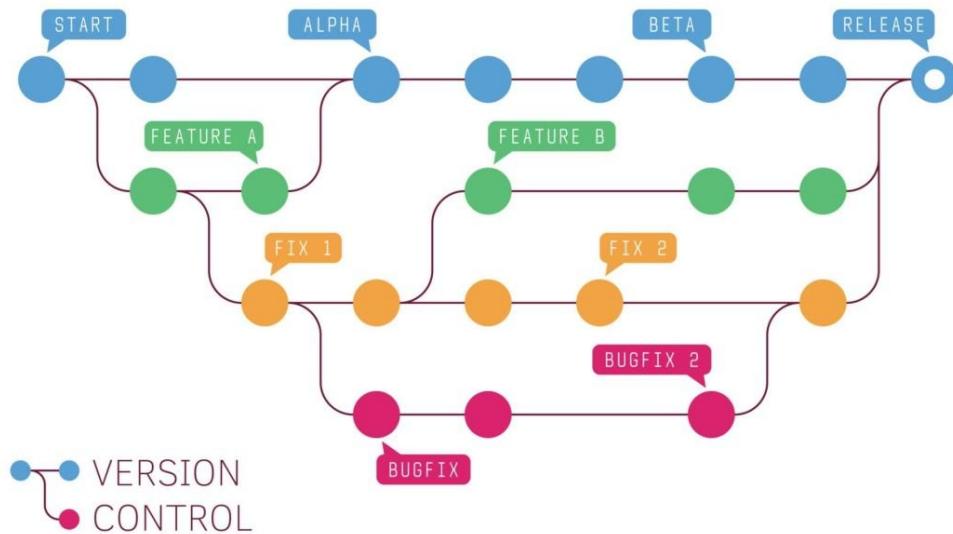

This screenshot shows the same Jenkins Pipeline configuration page as above, but with a dropdown menu open in the 'try sample Pipeline...' field. The menu includes options: 'try sample Pipeline...', 'Hello World' (which is highlighted with a red box), 'GitHub + Maven', and 'Scripted Pipeline'. A red arrow points to the 'Hello World' option.

8. Now Click on **Build Now** and you will see the Stage View of the Pipeline

This screenshot shows the Jenkins Pipeline stage view. On the left, there's a sidebar with options: Status (highlighted with a red box), Changes, Build Now (highlighted with a red box), Configure, Delete Pipeline, Full Stage View, Rename, Pipeline Syntax, and Build History. The main area is titled 'Stage View' and shows a single stage named 'Hello'. It displays average stage times: 131ms. Below the stage view, a table shows a build history entry for Dec 28 at 11:07 with 'No Changes' and a duration of 131ms. A red box highlights the 'Stage View' section.

Leveraging Version Control for Collaboration and Consistency

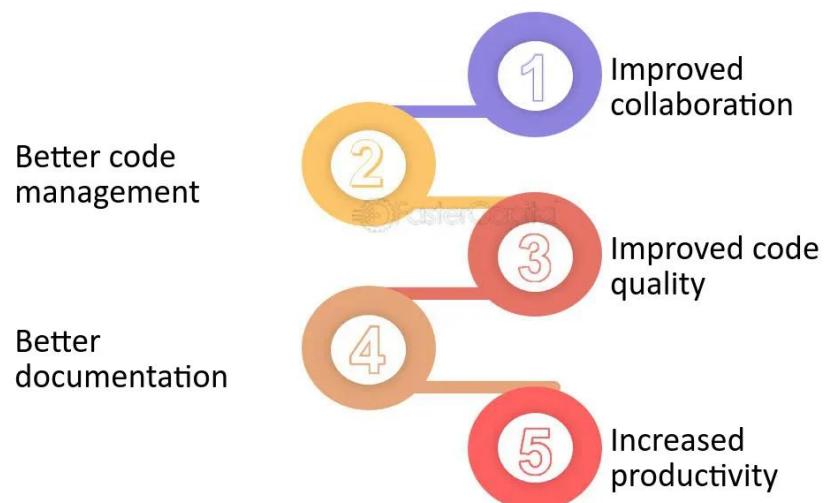

What are Version Control Systems?

VCS are tools that enable developers to manage changes to code over time. This is achieved by tracking each change, or commit, made to the codebase, creating a timeline of the code's evolution. VCS provide a central repository for the code, accessible to all members of the team, enabling them to work on the codebase simultaneously without conflicts. Additionally, VCS enable developers to roll back changes, compare versions of the code, and collaborate on new features.

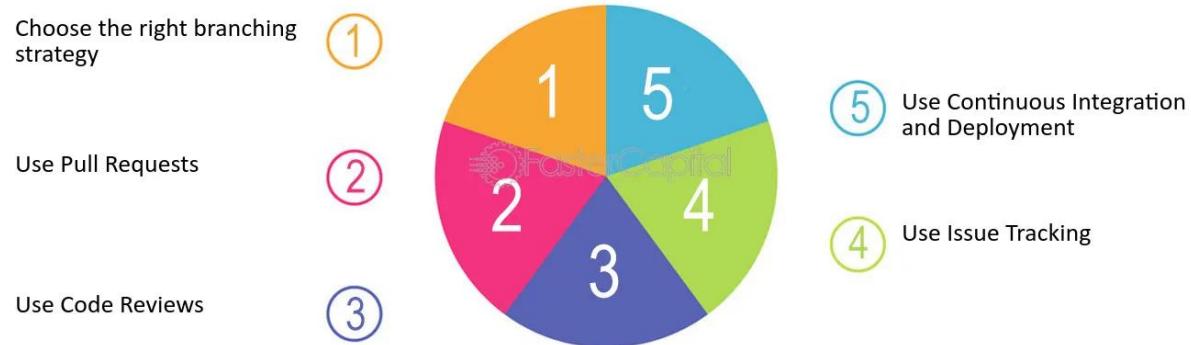

Benefits of Version Control

The Benefits of Using Version Control in Your Backend Plan

Collaborating with Others in Version Control

Collaborating with Others in Version Control

Module 3: Hands-on CI/CD Pipeline Setup

GitLab

GitLab is a suite of tools for managing different aspects of the software development lifecycle. The core product is a web-based Git repository manager with features such as issue tracking, analytics, and a Wiki.

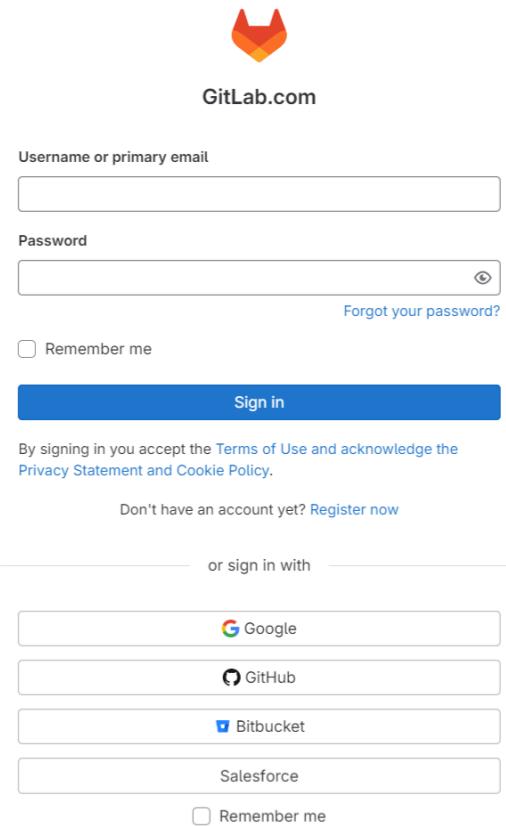

- GitLab allows you to trigger builds, run tests, and deploy code with each commit or push. You can build jobs in a virtual machine, Docker container, or on another server.

GitLab key features:

- View, create, and manage codes and project data through branching tools
- Design, develop, and manage codes and project data from a single distributed version control system, enabling rapid iteration and delivery of business values
- Provides a single source of truth and scalability for collaborating on projects and code
- Helps delivery teams fully embrace CI by automating the builds, integration, and verification of source codes
- Provides container scanning, static application security testing (SAST), dynamic application security testing (DAST), and dependency scanning to deliver secure applications along with license compliance
- Helps automate and shorten releases and delivery of applications
- **License:** GitLab is a commercial tool and free package. It offers hosting SaaS on GitLab or on your instance on-premises and/or on the public cloud.

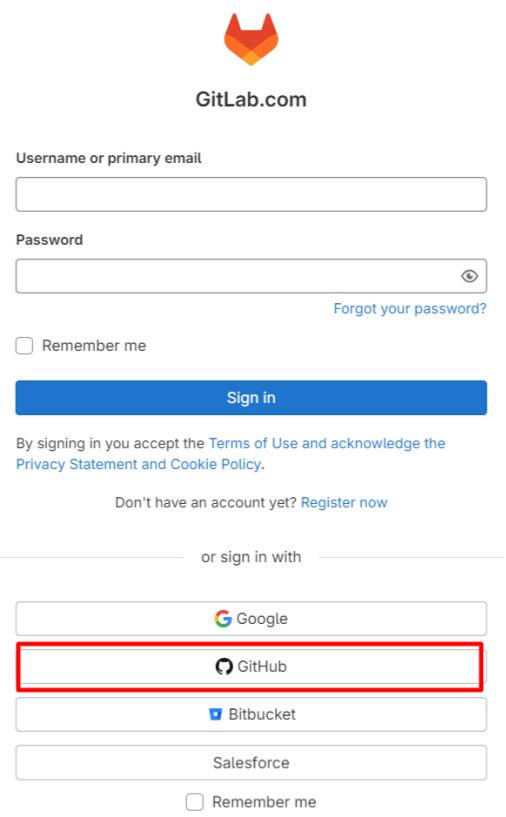

Learning Activity: Setting Up a Basic CI/CD Pipeline

1. Open GitLab the follow link
https://gitlab.com/users/sign_in

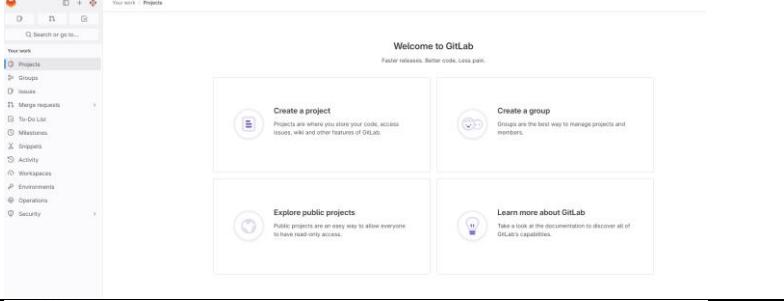

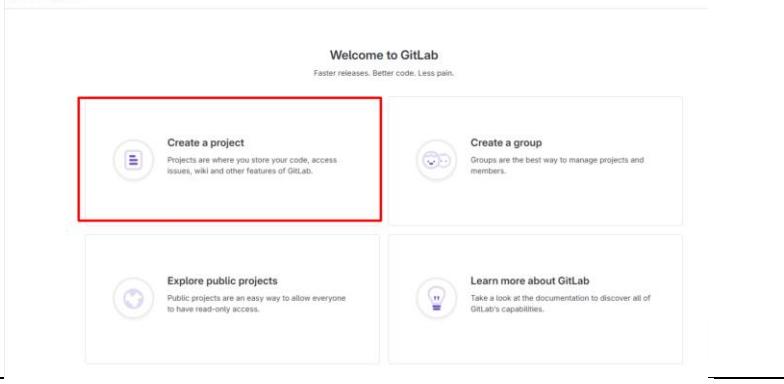

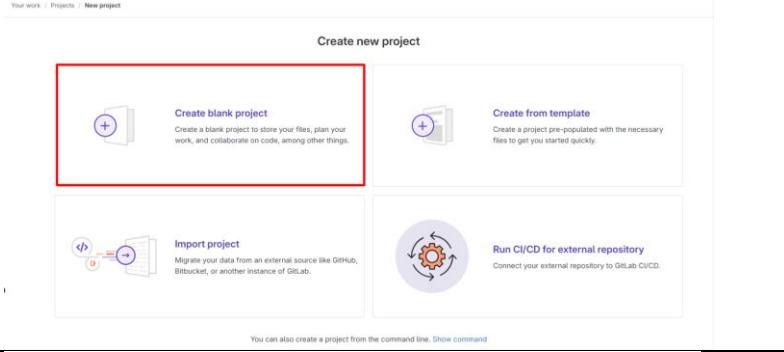

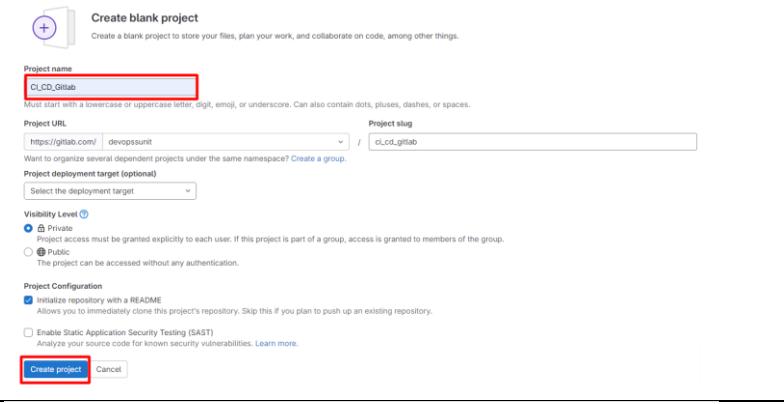

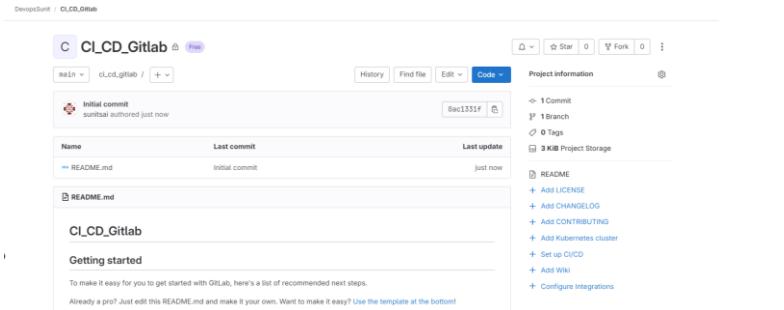

The image shows the GitLab.com login page. It features a logo at the top right, followed by fields for 'Username or primary email' and 'Password'. Below these are links for 'Forgot your password?' and 'Remember me'. A large blue 'Sign in' button is centered. Below the button, a note states: 'By signing in you accept the Terms of Use and acknowledge the Privacy Statement and Cookie Policy.' At the bottom, there's a link for 'Don't have an account yet? Register now' and a section for social logins with 'or sign in with' and options for Google, GitHub, Bitbucket, and Salesforce.

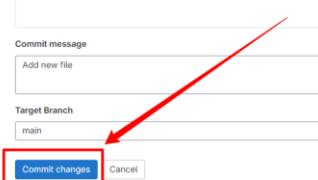

2. Login GitLab using GitHub Account.

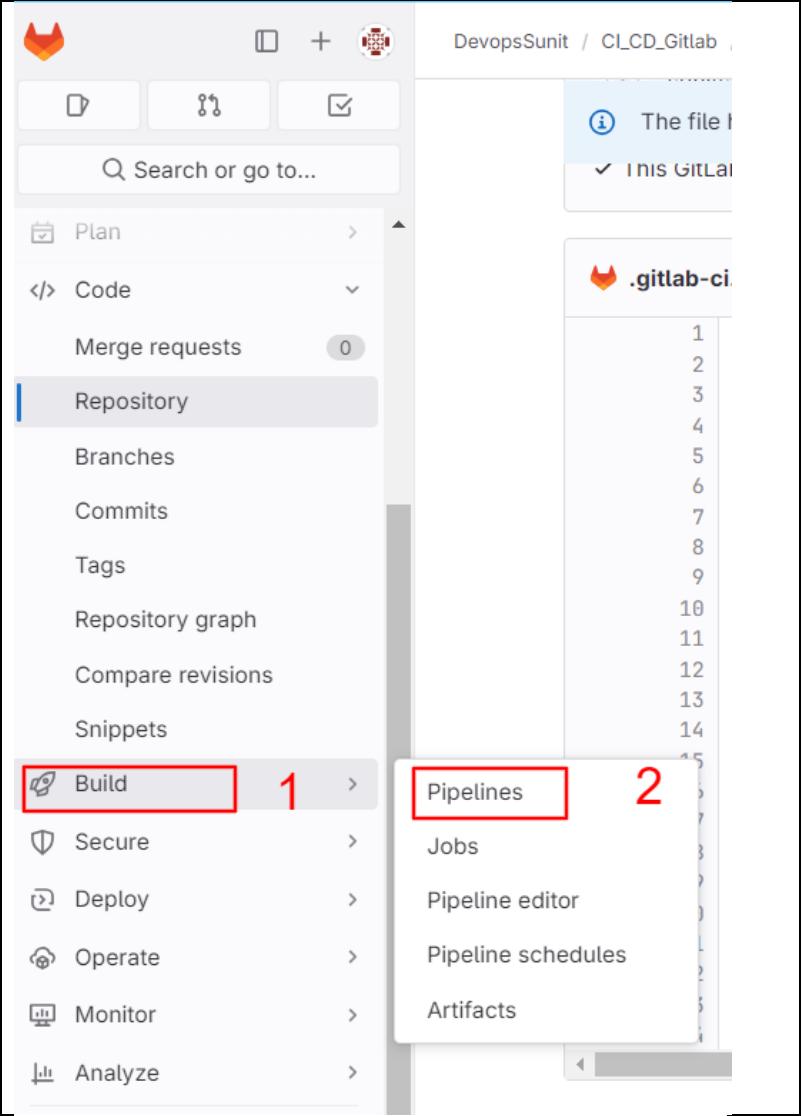

This image is identical to the one above, showing the GitLab.com login page. However, the 'GitHub' social login option is highlighted with a red rectangle, drawing attention to it as the specific method for logging in using a GitHub account.

3. After login we are able to see the GitLab Dashboard	
4. Now click Create Project on dashboard	
5. Now we will see the Create New Project Dashboard.	
6. Now select the Create Blank Project	
7. Now give the Project name show in the figure	
8. Now you will see a project file page shown in figure.	

<p>9. Now scroll down and come on the Test and Deploy section on same page.</p>	<p>Test and Deploy</p> <p>Use the built-in continuous integration in GitLab.</p> <ul style="list-style-type: none"> <input type="checkbox"/> Get started with GitLab CI/CD <input type="checkbox"/> Analyze your code for known vulnerabilities with Static Application Security Testing (SAST) <input type="checkbox"/> Deploy to Kubernetes, Amazon EC2, or Amazon ECS using Auto Deploy <input type="checkbox"/> Use pull-based deployments for improved Kubernetes management <input type="checkbox"/> Set up protected environments
<p>10. Now select the Get Started with GitLab CI/CD for the helping document.</p> <p>11. OR</p> <p>12. You can use this link to open the helping document. https://docs.gitlab.com/ee/ci/quick_start/index.html</p>	<p>Test and Deploy</p> <p>Use the built-in continuous integration in GitLab.</p> <ul style="list-style-type: none"> <input checked="" type="checkbox"/> Get started with GitLab CI/CD <input type="checkbox"/> Analyze your code for known vulnerabilities with Static Application Security Testing (SAST) <input type="checkbox"/> Deploy to Kubernetes, Amazon EC2, or Amazon ECS using Auto Deploy <input type="checkbox"/> Use pull-based deployments for improved Kubernetes management <input type="checkbox"/> Set up protected environments
<p>13. Now go to helping document page.</p>	<p>Tutorial: Create and run your first GitLab CI/CD pipeline <small>All tiers All offerings</small></p> <p>This tutorial shows you how to configure and run your first CI/CD pipeline in GitLab.</p> <p>If you are already familiar with basic CI/CD concepts, you can learn about common keywords in Tutorial: Create a complex pipeline.</p> <h3>Prerequisites</h3> <p>Before you start, make sure you have:</p> <ul style="list-style-type: none"> • A project in GitLab that you would like to use CI/CD for. • The Maintainer or Owner role for the project. <p>If you don't have a project, you can create a public project for free on https://gitlab.com.</p>
<p>14. Now again come on Project page on GitLab and select New File.</p>	 <p>The screenshot shows the GitLab interface for a repository named 'CI_CD_Gitlab'. In the top right corner, there is a '+ New' button. A dropdown menu is open from this button, showing several options: 'This directory', 'New file' (which is highlighted with a red box), 'Upload file', 'New directory', 'This repository', 'New branch', and 'New tag'. Below the dropdown, the repository name 'CI_CD_Gitlab' is visible.</p>

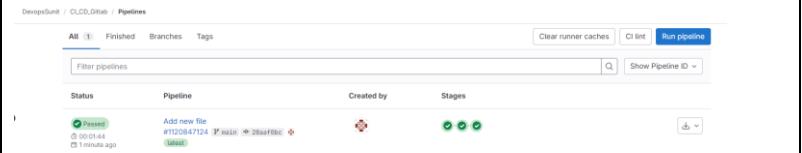

15. Give the file name <code>.gitlab-ci.yml</code>	<p>New file</p> <p>File main .gitlab-ci.yml Apply a template</p> <p>1</p>
16. Now open the helping document and scroll down till the Create a .gitlab-ci.yml file section and copy the code given in Step-3	<p>3. For the Filename, type <code>.gitlab-ci.yml</code> and in the larger window, paste this sample code:</p> <pre>build-job: stage: build script: - echo "Hello, \$GITLAB_USER_LOGIN!" test-job1: stage: test script: - echo "This job tests something" test-job2: stage: test script: - echo "This job tests something, but takes more time than test-job1." - echo "After the echo commands complete, it runs the sleep command for 20 seconds" - echo "which simulates a test that runs 20 seconds longer than test-job1" - sleep 20 deploy-prod: stage: deploy script: - echo "This job deploys something from the \$CI_COMMIT_BRANCH branch."</pre> 
17. Paste the code in new created file and click on Commit Changes .	<p>Commit message Add new file</p> <p>Target Branch main</p> <p>Commit changes Cancel</p> 

18. Now click on **Build** on side panel and select **Pipeline**.

The screenshot shows the left sidebar of the GitLab interface. The 'Build' item under the 'Pipelines' section is highlighted with a red box and labeled '1'. A dropdown menu for 'Build' is open, showing 'Pipelines' highlighted with a red box and labeled '2'.

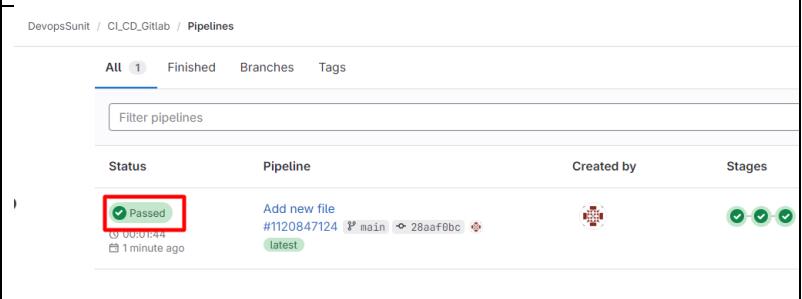

19. Now you will see the **Pipeline Page**.

The screenshot shows the 'Pipelines' page in GitLab. It displays a single pipeline entry with the status 'Passed'.

Status	Pipeline	Created by	Stages
Passed	Add new file #1120847124	John Doe	Passed

20. To see the pipeline click on **Status**.

The screenshot shows the 'Pipelines' page in GitLab. It displays a single pipeline entry with the status 'Passed' highlighted with a red box.

Status	Pipeline	Created by	Stages
Passed	Add new file #1120847124	John Doe	Passed

21. You will see the Pipeline and Stages.

Passed sunitsai created pipeline for commit 28aaaf0bc finished 2 minutes ago

For main

latest → 4 Jobs 2.2 1 minute 44 seconds, queued for 1 seconds

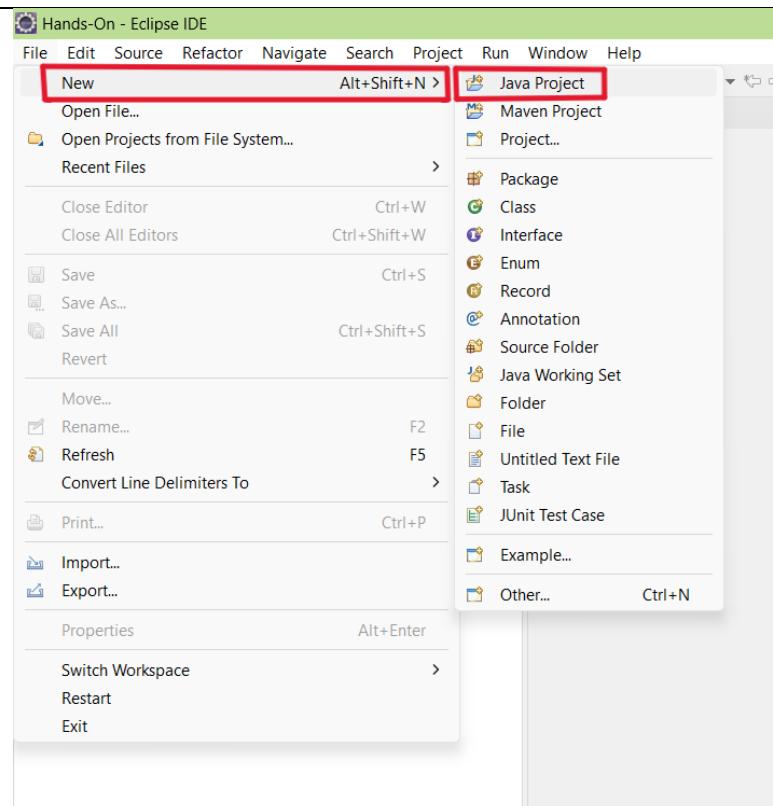

Pipeline Needs Jobs 4 Tests 0

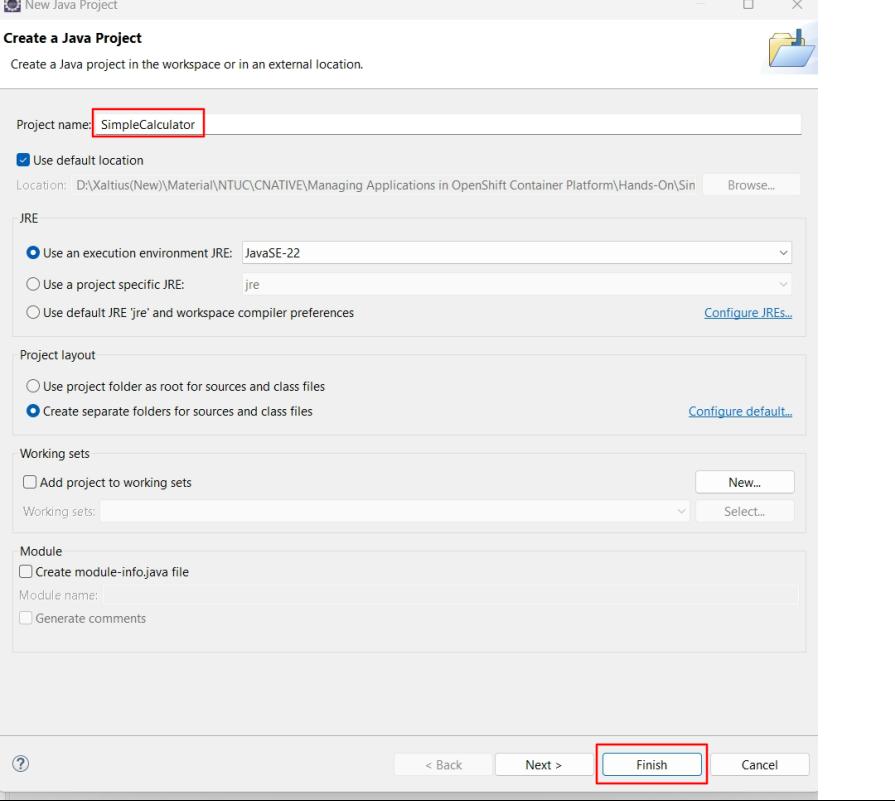

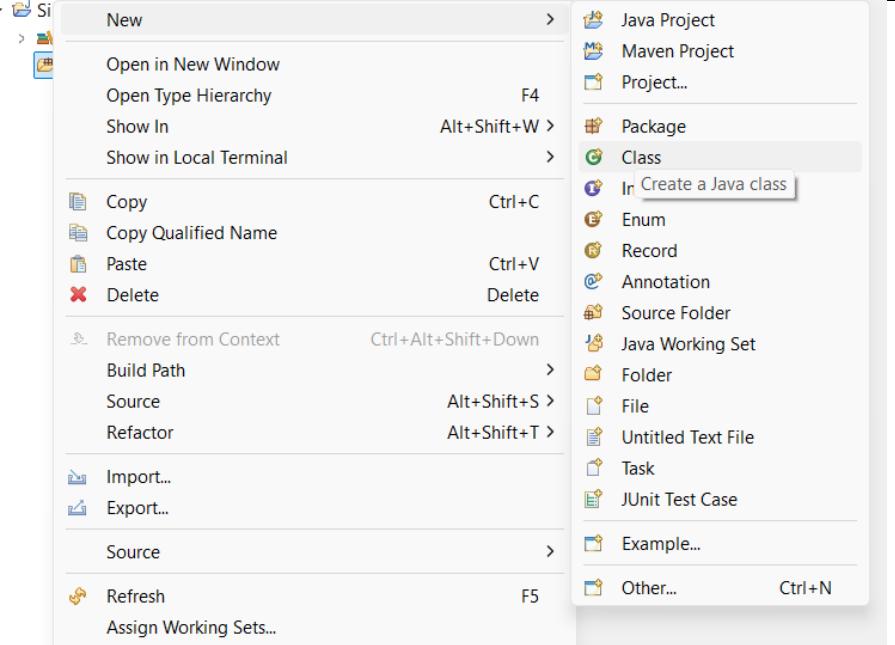

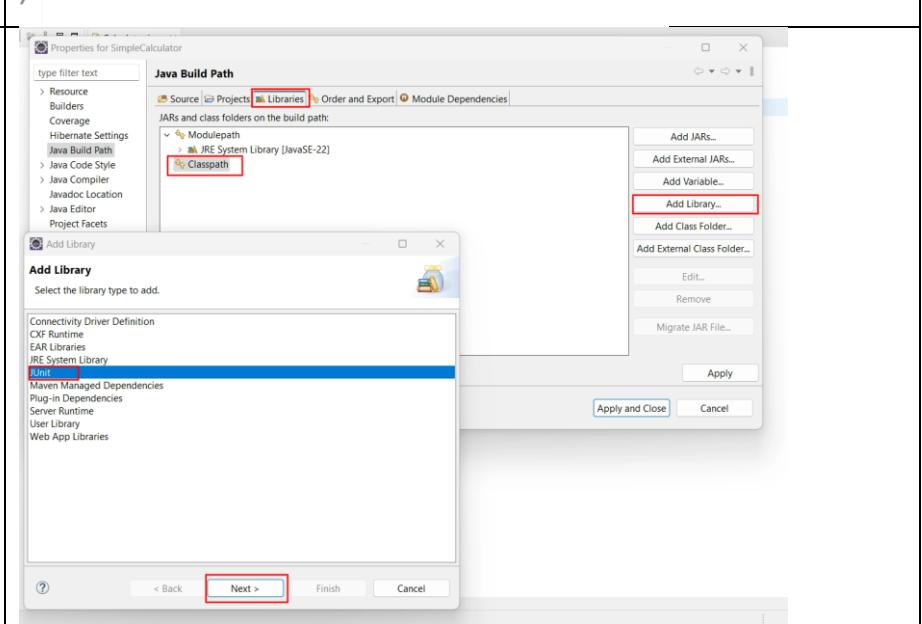

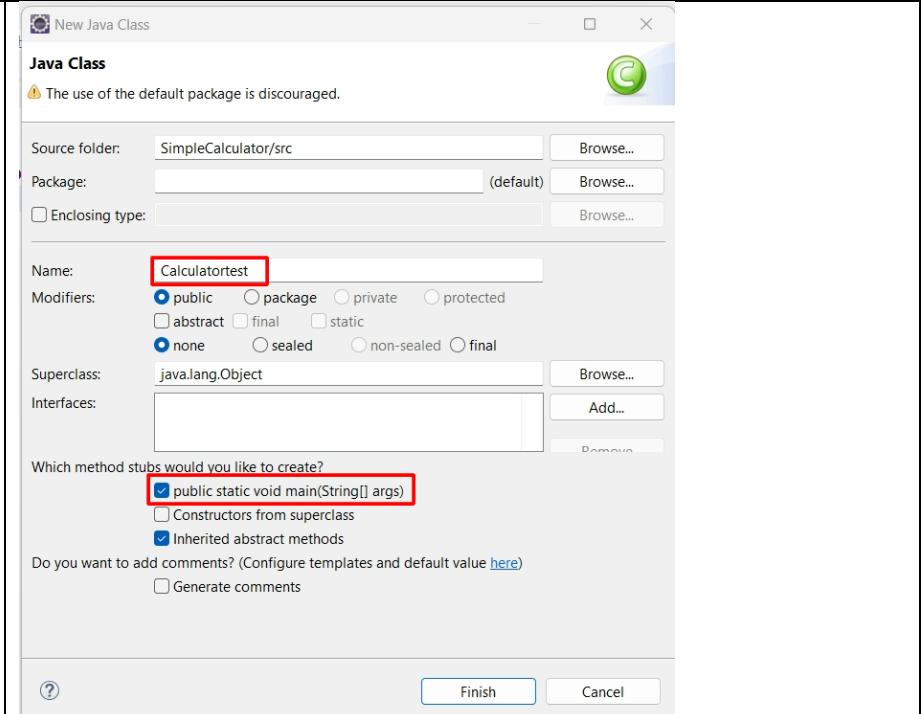

Configuring Automated Testing, Build, and Deployment Stages

Here's a simple, step-by-step **automated testing** tutorial using **Java** with a basic **JUnit** test. This example will test a simple calculator that can add two numbers.

1. Open Eclipse IDE and click on File→ New → Java Project

<p>2. Create a Project:</p> <ul style="list-style-type: none"> Enter a name for your project, e.g., SimpleCalculator. Click Finish. 	
<p>3. Create a New Class:</p> <ul style="list-style-type: none"> Right-click on the src folder in the Package Explorer on the left panel. Select New → Class. In the dialog box, name the class Calculator and click Finish. 	
<p>4. Now add the following code to the Calculator.java file.</p>	<pre>public class Calculator { public int add(int a, int b) { return a + b; } }</pre>

	<pre> 1 2 public class Calculator { 3 public int add(int a, int b) { 4 return a+b; 5 } 6 } 7 </pre> 
<p>5. Add JUnit Library:</p> <ul style="list-style-type: none"> Right-click on your project in the Package Explorer. Select Build Path → Configure Build Path. In the Libraries tab, click Add Library → Select JUnit → Click Next → Choose JUnit 5 and click Finish. 	

7. Now add the following test code to the CalculatorTest.java file to test if the add method works correctly.

```
import static org.junit.jupiter.api.Assertions.assertEquals;
import org.junit.jupiter.api.Test;

public class CalculatorTest {

    @Test
    public void testAdd() {
        Calculator calculator = new Calculator();
        int result = calculator.add(3, 2);
        assertEquals(5, result, "The add method should return the sum of 3 and 2.");
    }
}
```

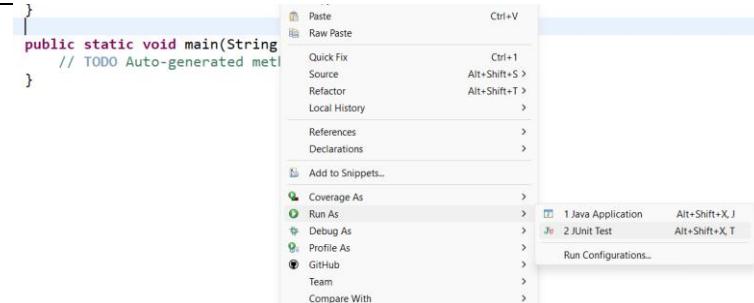

```
import static org.junit.jupiter.api.Assertions.assertEquals;
import org.junit.jupiter.api.Test;

public class CalculatorTest {

    @Test
    public void testAdd() {
        Calculator calculator = new Calculator();
        int result = calculator.add(3, 2);
        assertEquals(5, result, "The add method should return the sum of 3 and 2.");
    }

    public static void main(String[] args) {
        // TODO Auto-generated method stub
    }
}
```

8. Run the Test:
- Right-click on CalculatorTest.java in the Package Explorer.
 - Select Run As → JUnit Test.

9. Understanding the Test Results

- Green Bar:** This means the test passed successfully, and the add method returned the correct result.
- Red Bar:** If the bar is red, the test failed. This means the add method did not return the expected result, and the problem needs to be fixed.

Implementing Version-controlled Infrastructure as Code

Terraform will prompt for confirmation before destroying the resources. This is useful for cleanup or testing purposes.

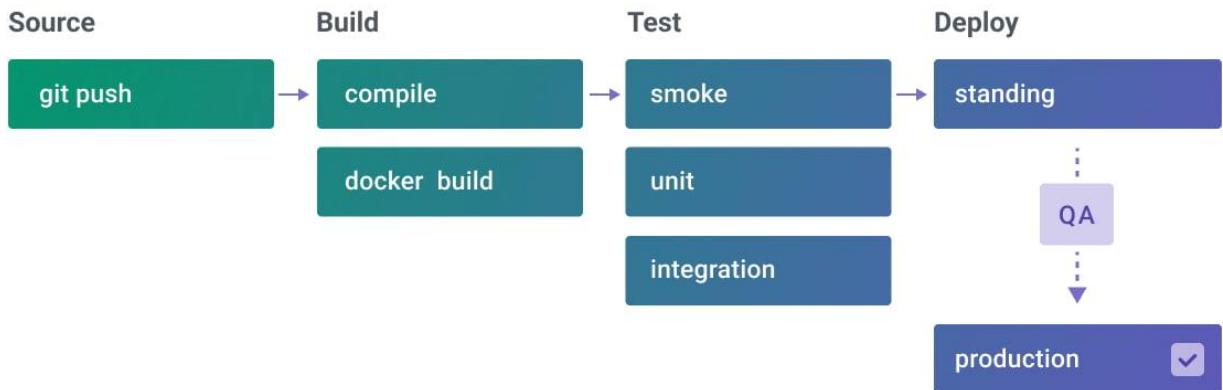

Key Concepts for Version-Controlled IaC

- Configuration Files:** Store all infrastructure configurations in files (.tf files for Terraform).
- State Management:** Terraform keeps track of your infrastructure state in a terraform.tfstate file. This file is important for versioning and tracking the state of your infrastructure.
- Version Control:** Store configuration files in a Git repository to track every change.
- Automation:** Use CI/CD pipelines with Terraform to automate infrastructure deployment based on the latest code changes in your Git repository.

Advanced Considerations

- Remote State Storage:** Store the Terraform state file in a remote location (like AWS S3 or Azure Blob Storage) to collaborate on infrastructure management with teams.
- Modules:** Organize your Terraform code into reusable modules for complex infrastructure setups.
- CI/CD Integration:** Integrate Terraform with CI/CD tools like Jenkins, GitHub Actions, or GitLab CI to automate deployments from version-controlled IaC code.

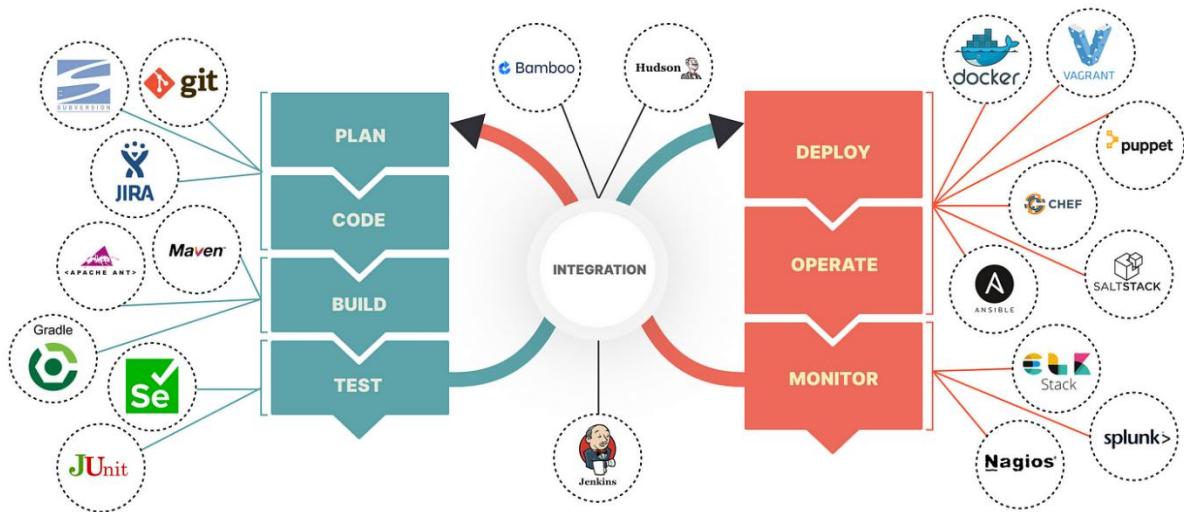

Best Practices for Designing Reliable and Efficient Pipelines

Best Practices

- **Version Control:** Use a robust version control system like Git to manage code changes.
- **Automated Testing:** Write unit tests, integration tests, and end-to-end tests to validate code changes automatically.
- **Automated Builds:** Set up automated build pipelines that compile code, package applications, and create artifacts.
- **Frequent Integration:** Encourage developers to integrate code changes into the shared repository multiple times a day.
- **Feedback Loops:** Implement feedback mechanisms to notify developers of build and test results.

Module 4: Tools and Practices for Continuous Monitoring

Understanding the Importance of Continuous Monitoring

Continuous quality monitoring in DevOps is the process of identifying threats to the security and compliance rules of a software development cycle and architecture. Also known as continuous control monitoring or CCM, this is an automated procedure that can be extended to detect similar inconsistencies in IT infrastructures. Continuous monitoring helps business and technical teams determine and interpret analytics to solve crucial issues, as mentioned above, instantaneously. Digital experience monitoring, or DEM, on the other hand, is the process of optimizing the operational behaviour and experience of a system.

Importance of Continuous Monitoring

Continuous monitoring in DevOps has a few specific goals, as are mentioned below:

1. Many components of software operations can trigger devastating outcomes like breaches. Continuous monitoring aims to strengthen the transparency of such environments while keeping in place a vigilant system to monitor and resolve said issues.
2. Continuous monitoring aims to identify performance inconsistencies and error sources. It also resolves these problems using relevant solutions to safeguard the enterprise.
3. Continuous monitoring assists companies in keeping a tab of their user experience. CM is especially helpful in tracking user feedback after a recent change or update to a software or an application. This helps firms build and strengthen their business strategies.

DevOps tools for Infrastructure Monitoring

- Nagios
- Prometheus

DevOps Tools for Application Monitoring

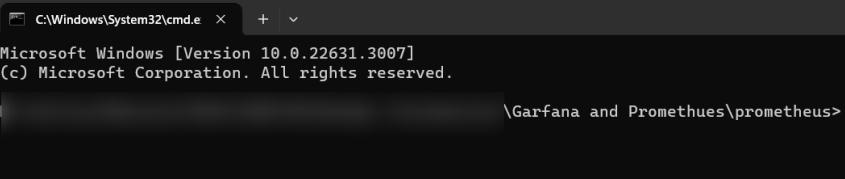

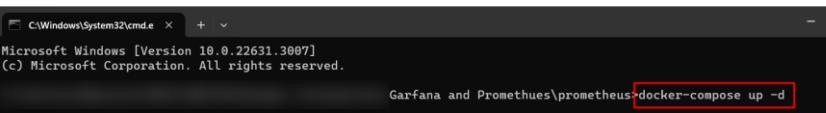

- Datadog
- Splunk

DevOps Tools for Networking Monitoring

- Wireshark
- NMap- Network Mapper

Exploring Monitoring Tools: Prometheus, Grafana, ELK Stack

Setup the Grafana Monitoring Tool:

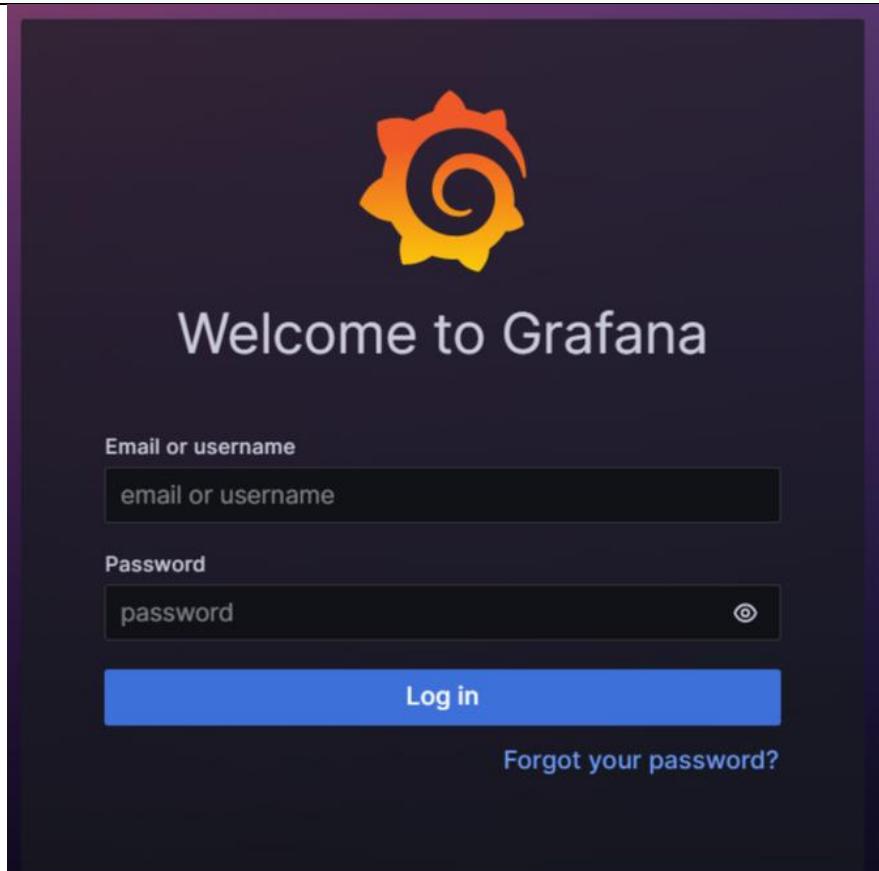

<p>1. Download the Zip file named Grafana_Prometheus from the Example folder.</p>	
<p>2. Extract that file and go inside that file and open CMD.</p>	
<p>3. Now type the following command in CMD to compose the data in the your docker.</p>	
<p>4. docker-compose up -d</p>	

- 5. Open your docker desktop and you will see the 3 containers for Grafana**

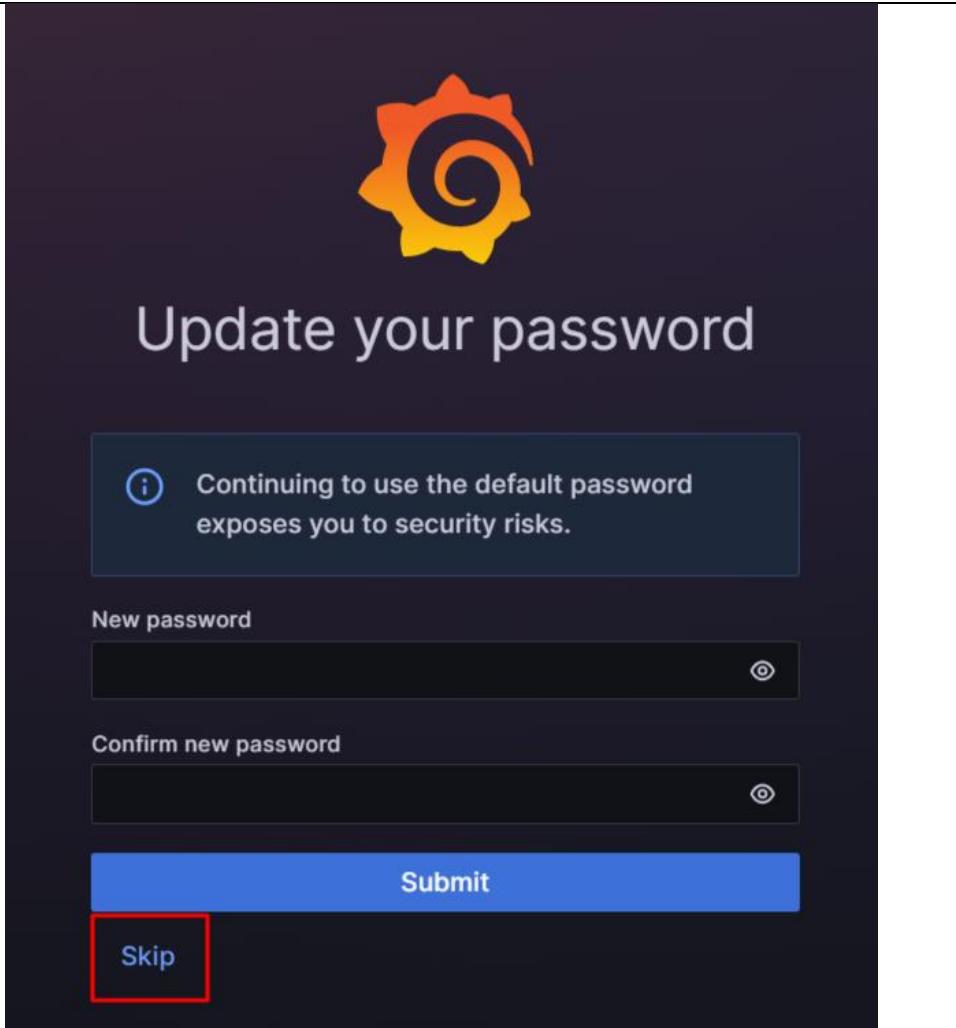

Containers Give feedback											
Container CPU usage		Container memory usage		Show charts							
0.11% / 800% (8 cores available)	142.29MB / 7.47GB										
<input type="text"/> Search		<input checked="" type="checkbox"/> Only show running containers									
Name	Image	Status	CPU (%)	Port(s)	Last started	Actions					
grafana	grafana/grafana	Running (3/3)	0.11%	17 minutes ago	<input type="button"/> <input type="button"/> <input type="button"/>						
prometheus	prom/prometheus	Running	0%	35 minutes ago	<input type="button"/> <input type="button"/> <input type="button"/>						
alertmanager	prom/alertmanager	Running	0.07%	35 minutes ago	<input type="button"/> <input type="button"/> <input type="button"/>						
grafana	grafana/grafana	Running	0.04%	17 minutes ago	<input type="button"/> <input type="button"/> <input type="button"/>						
prometheus	prom/prometheus	Running	0%	35 minutes ago	<input type="button"/> <input type="button"/> <input type="button"/>						

Showing 5 items

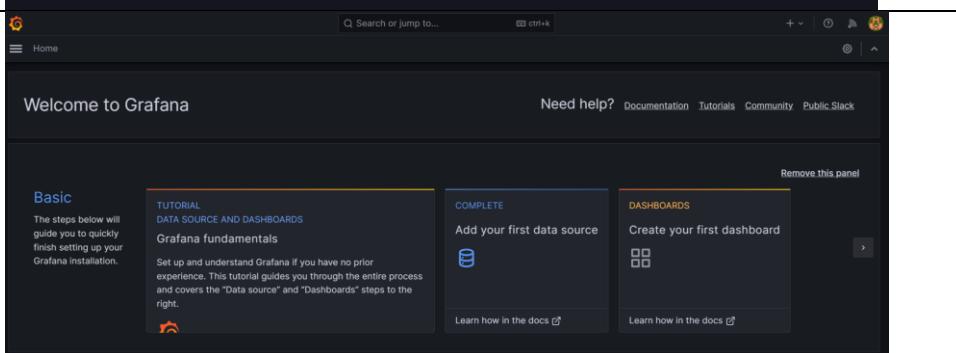

- 6. Now open your browser and run the follow URL to launch the Grafana.**
- 7. <http://localhost:3000/login>**

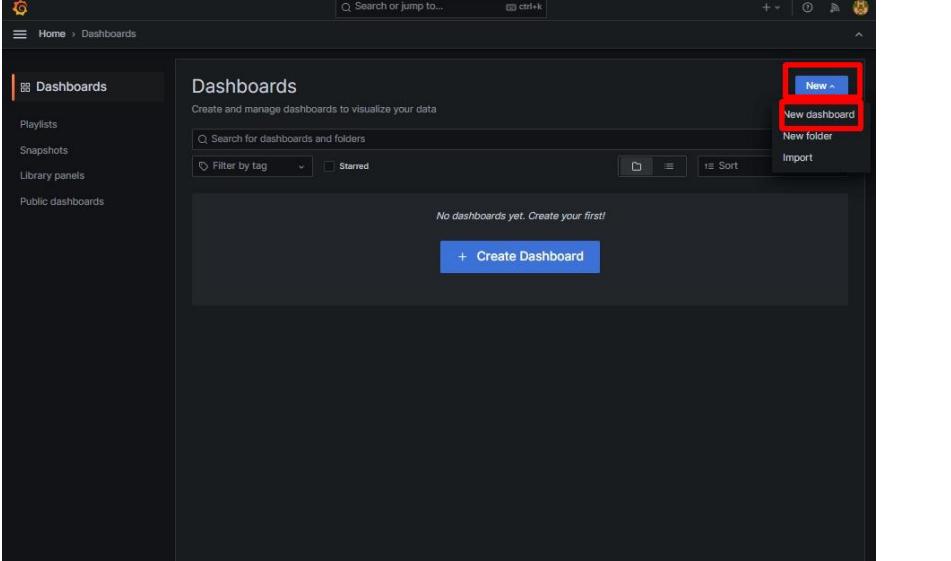

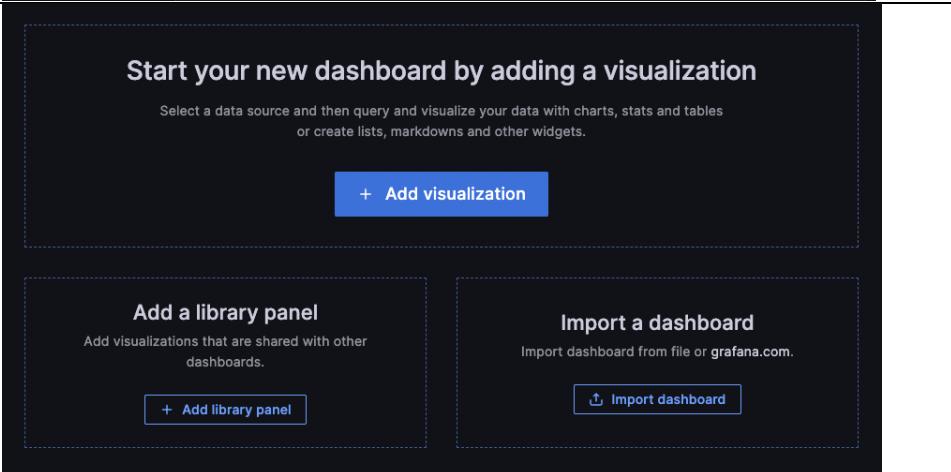

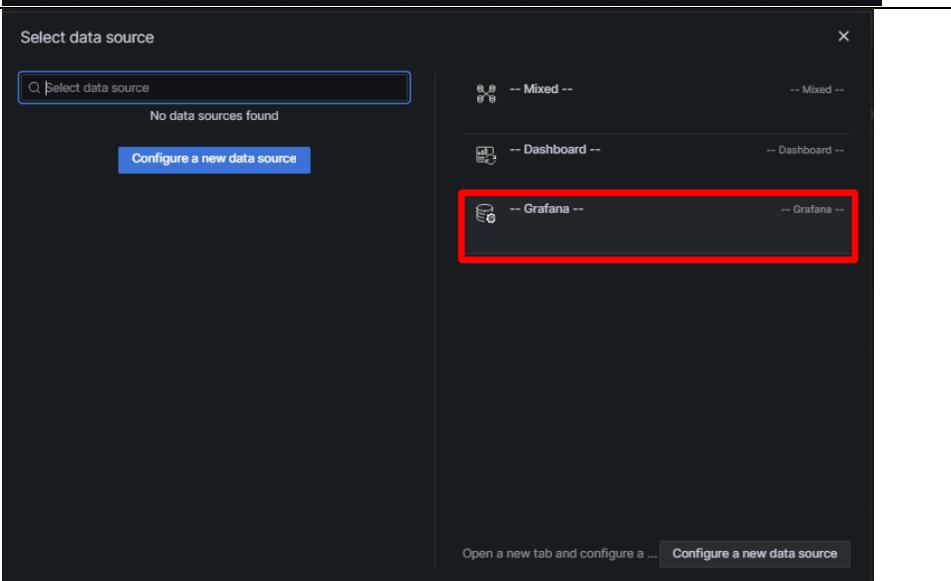

8. Now type the Username and Password.
9. Username: admin
10. Password: admin

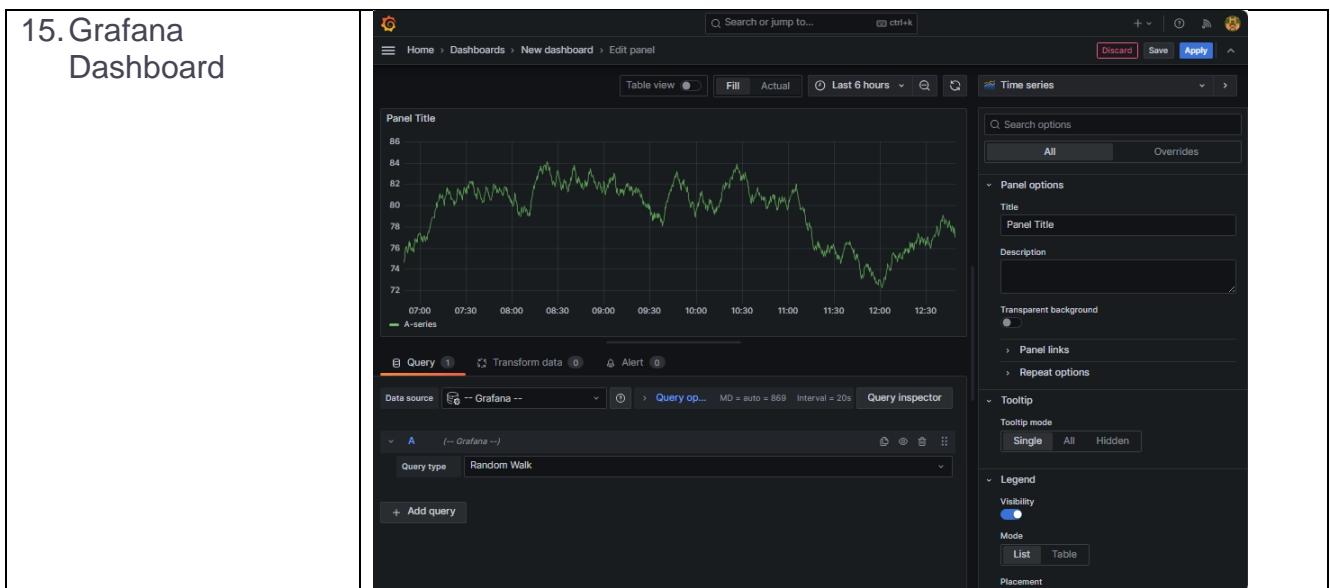

11. You will see the Grafana Dashboard

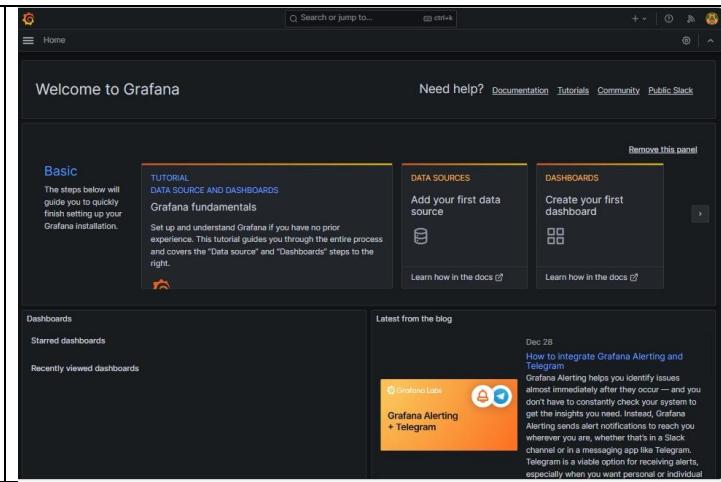

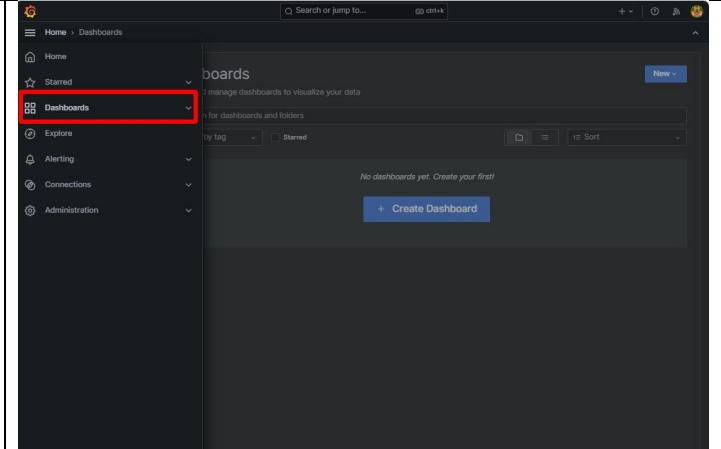

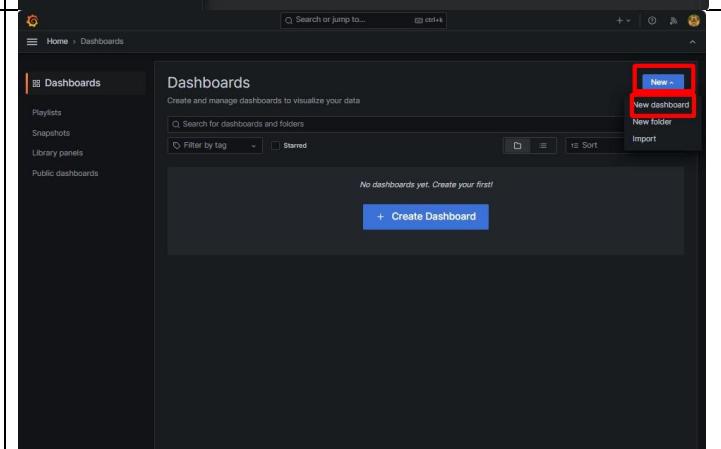

<p>12. On the Dashboards page, click New and select New Dashboard from the drop-down menu.</p>	
<p>13. On the dashboard, click + Add visualization.</p>	
<p>14. In the dialog box that opens, click -- Grafana --:</p>	

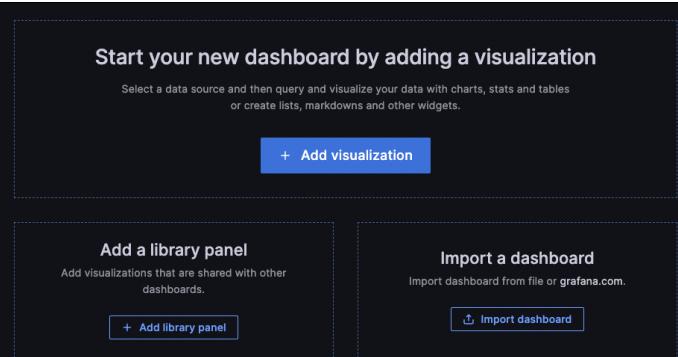

15. Grafana Dashboard

Setup the Prometheus Monitoring Tool:

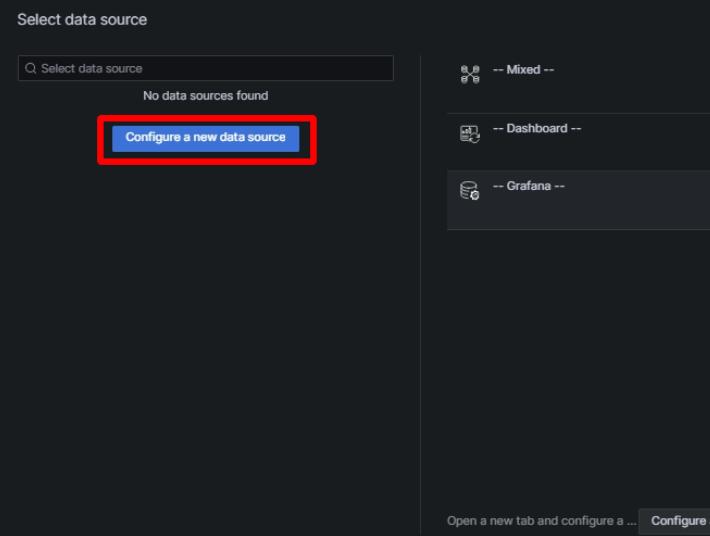

1. Grafana Dashboard	
2. Click Dashboards in the left-side menu.	
3. On the Dashboards page, click New and select New Dashboard from the drop-down menu.	

4. On the dashboard, click **+ Add visualization**.

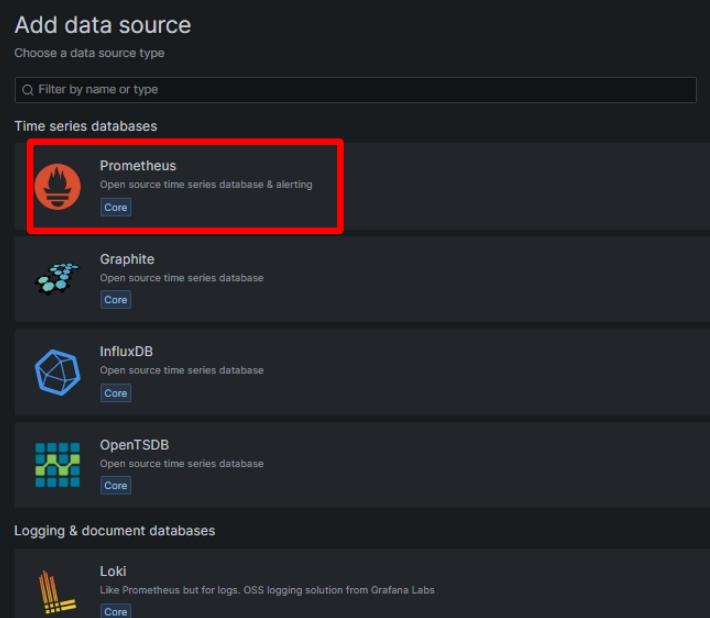

The screenshot shows the Grafana interface for creating a new dashboard. At the top, it says "Start your new dashboard by adding a visualization". Below that is a text input field with placeholder text: "Select a data source and then query and visualize your data with charts, stats and tables or create lists, markdowns and other widgets." A blue button labeled "+ Add visualization" is centered below the input field. To the left, there's a section titled "Add a library panel" with a sub-section "Import a dashboard". To the right, there's a section titled "Import a dashboard" with a sub-section "Import dashboard".

5. Now click on **Configure a new data source**

The screenshot shows the "Select data source" screen in Grafana. It features a search bar at the top with the placeholder "Select data source" and a message "No data sources found". Below the search bar is a blue button labeled "Configure a new data source", which is highlighted with a red box. To the right, there are three categories: "Mixed" (with icons for MySQL, PostgreSQL, and MongoDB), "Dashboard" (with a folder icon), and "Grafana" (with a database icon). At the bottom right, there are links "Open a new tab and configure a ..." and "Configure".

6. Now click **Prometheus**

The screenshot shows the "Add data source" screen in Grafana. It starts with a heading "Choose a data source type" and a search bar "Filter by name or type". Below that is a section titled "Time series databases". It lists several options: "Prometheus" (highlighted with a red box), "Graphite", "InfluxDB", and "OpenTSDB". Each item has a small icon and a "Core" button. Below this section is another titled "Logging & document databases" which contains one item: "Loki".

7. Now write down the Connection URL
8. <http://prometheus:9090>

Connection

Prometheus server URL * http://prometheus:9090

Authentication

Authentication methods

Home > Explore

- Home
- Starred
- Dashboards
- Explore** localhost:9090
- Alerting

Add query Query history Query inspector

9. Now click on **Explore** from Grafana Side Panel

10. Now Prometheus Dashboard will open.

What is the ELK Stack?

elasticsearch

The ELK Stack began as a collection of three open-source products — Elasticsearch, Logstash, and Kibana — all developed, managed and maintained by Elastic. The introduction and subsequent addition of Beats turned the stack into a four-legged project.

How to use the ELK Stack?

Setup the ELK Monitoring Tool:

1. Download the Elastic Search ZIP from the following link:
2. <https://www.elastic.co/downloads/elasticsearch>

Download Elasticsearch

- 1 Download and unzip Elasticsearch

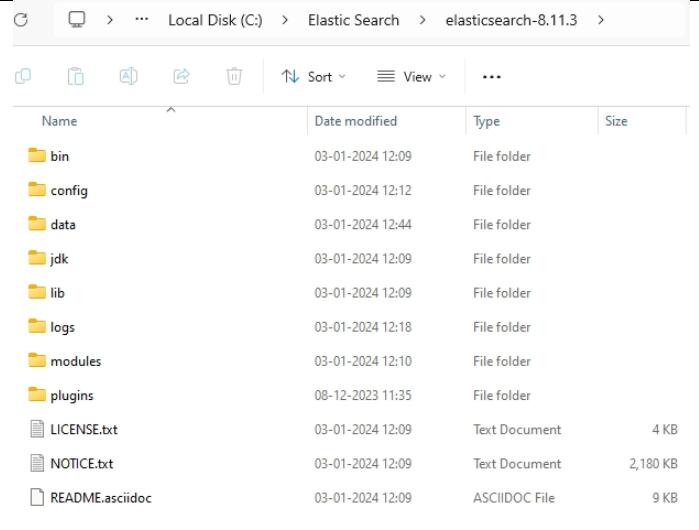

Choose platform:

Windows

[Windows](#)

[sha](#) [asc](#)

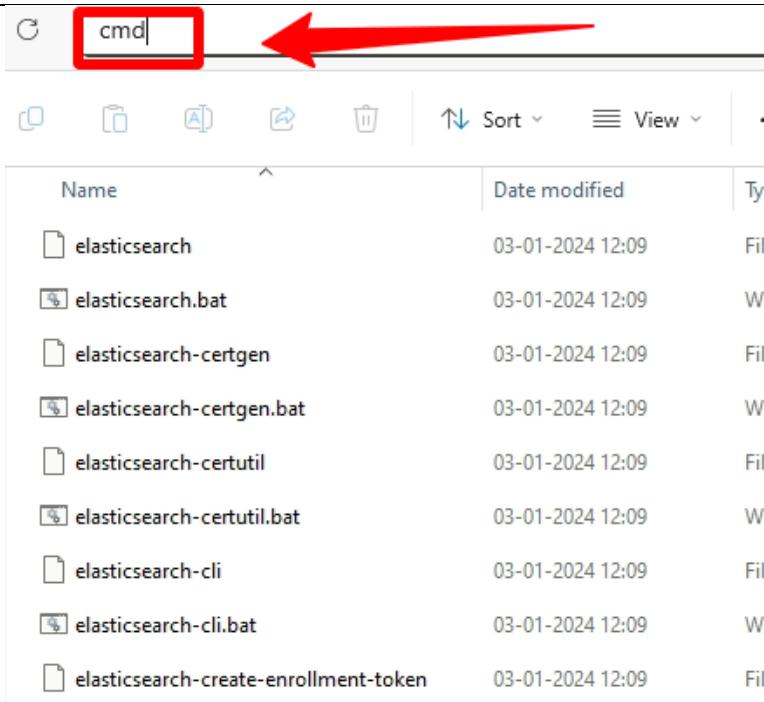

3. Unzip the folder in any of the drives.

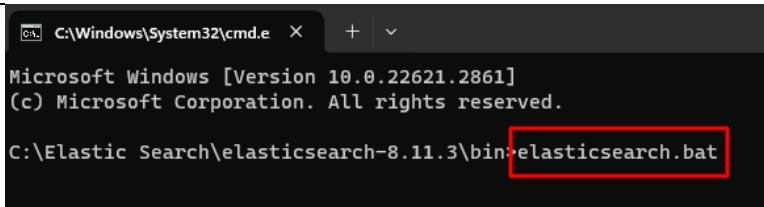

The screenshot shows a Windows File Explorer window displaying the contents of the 'elasticsearch-8.11.3' folder. The path in the address bar is 'Local Disk (C:) > Elastic Search > elasticsearch-8.11.3'. The folder contains several subfolders: bin, config, data, jdk, lib, logs, modules, and plugins. It also contains three text files: LICENSE.txt, NOTICE.txt, and README.asciidoc. The table below provides a detailed view of the folder structure and file details.

Name	Date modified	Type	Size
bin	03-01-2024 12:09	File folder	
config	03-01-2024 12:12	File folder	
data	03-01-2024 12:44	File folder	
jdk	03-01-2024 12:09	File folder	
lib	03-01-2024 12:09	File folder	
logs	03-01-2024 12:18	File folder	
modules	03-01-2024 12:10	File folder	
plugins	08-12-2023 11:35	File folder	
LICENSE.txt	03-01-2024 12:09	Text Document	4 KB
NOTICE.txt	03-01-2024 12:09	Text Document	2,180 KB
README.asciidoc	03-01-2024 12:09	ASCIIDOC File	9 KB

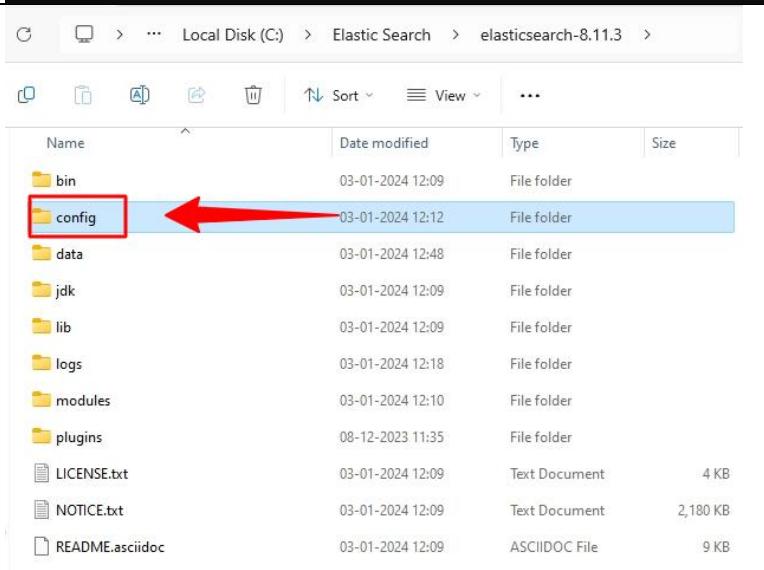

4. Now go in side the **bin** folder and launch the **CMD** with the path of **bin** folder.

5. Now cmd will open and type **elasticsearch.bat**

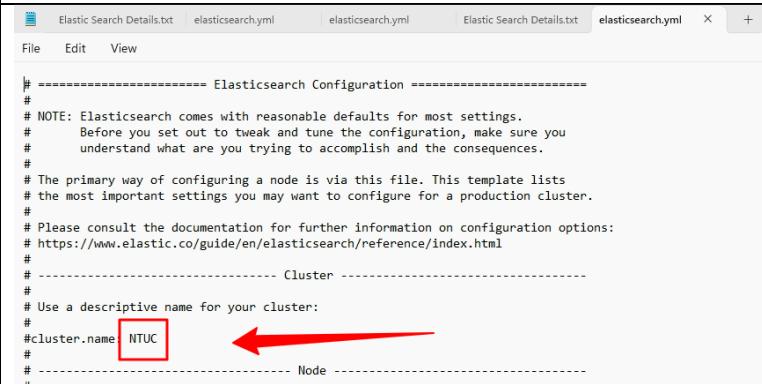

6. Now go in the **config** folder inside the elastic search root folder.

7. Open the **elasticsearch.yml** file in notepad.

Name	Date modified	Type	Size
certs	03-01-2024 12:12	File folder	
jvm.options.d	08-12-2023 11:35	File folder	
elasticsearch.keystore	03-01-2024 12:12	KEYSTORE File	1 KB
elasticsearch.yml	03-01-2024 12:17	YML File	5 KB
elasticsearch-plugins.example.yml	03-01-2024 12:09	YML File	2 KB
jvm.options	03-01-2024 12:09	OPTIONS File	3 KB
log4j2.properties	03-01-2024 12:09	PROPERTIES File	18 KB
role_mapping.yml	03-01-2024 12:09	YML File	1 KB
roles.yml	03-01-2024 12:09	YML File	1 KB
users	03-01-2024 12:09	File	0 KB
users_roles	03-01-2024 12:09	File	0 KB

8. Now after open the file change the name of **cluster.name = NTUC**

```

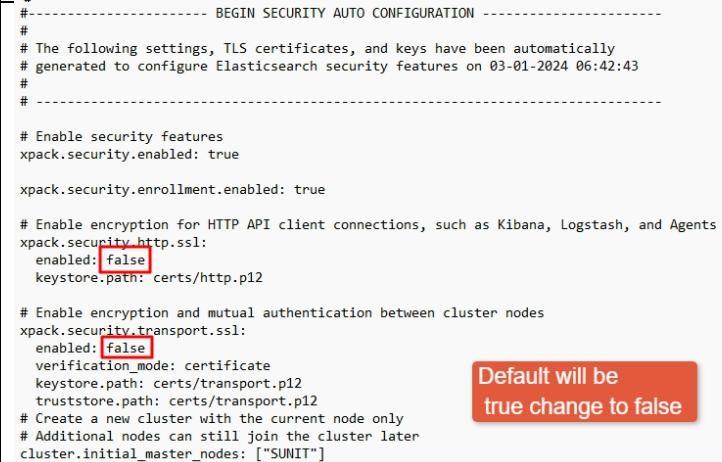

# -----
# Elasticsearch Configuration
#
# NOTE: Elasticsearch comes with reasonable defaults for most settings.
# Before you set out to tweak and tune the configuration, make sure you
# understand what are you trying to accomplish and the consequences.
#
# The primary way of configuring a node is via this file. This template lists
# the most important settings you may want to configure for a production cluster.
#
# Please consult the documentation for further information on configuration options:

elasticsearch-create-enrollment-token	03-01-2024 12:09	File	1 KB																																						
<p>11. Now cmd will open and type elasticsearch.bat</p>	 <pre>Microsoft Windows [Version 10.0.22621.2861] (c) Microsoft Corporation. All rights reserved. C:\Elastic Search\elasticsearch-8.11.3\bin>elasticsearch.bat</pre>																																								
<p>12. Now you will get the password and key token for Kibana copy that and paste it into notepad.</p>	 <pre>Password for the elastic user (reset with 'bin/elasticsearch-reset-password -u elastic'): A-XBQ+s+69BEM83ajDgY Elastic Search Password Configure Kibana to use this cluster: F0 Copy the following enrollment token and paste it into Kibana in your browser (valid for the next 30 minutes): eyJ2XXI1O1I4ljExLjMlC3hZHIiolsiMTkyIjE20C40My4Mjg6OTIwMCJdLCJmZ3Ii01jK2NjYwJiODMwYzUzNzIiMjfmNWIZnzc3YzhjOTMzYiYODJZKHTgwM2MmMz2ZDIwMjc1bDA4NDlnIwiia2V5Ijo1VdrUxpvd0JfRnJWj1ESUpoTGU6bVmV1VDFSYX8UWEdydkdHYNQ4LXdSzYj9 Configure other nodes to join this cluster: F0 On this node: Create an enrollment token with `bin/elasticsearch-create-enrollment-token -s node`. Uncomment the transport.host setting at the end of config/elasticsearch.yml. Restart Elasticsearch. F0 On other nodes: Start Elasticsearch with `bin/elasticsearch --enrollment-token <token>`, using the enrollment token that you generated above. Configure other nodes to join this cluster by setting the transport.host setting in config/elasticsearch.yml. Restart Elasticsearch. Kibana Key token</pre>																																								
<p>13. Open the browser and type the follow URL: 14. Localhost:9200</p>																																									
<p>15. Username: elastic 16. Password: Copy from notepad which you have save from CMD</p>																																									
<p>17. Output</p>	<pre>{ "name": "elasticsearch", "cluster_name": "elasticsearch", "cluster_uuid": "FO121m6YRP6cpDHjWqwF4W", "version": { "number": "8.11.3", "build_flavor": "default", "build_type": "zip", "build_hash": "64cf052f3b56b1fd4449f5454cb88aca7e739d9a", "build_date": "2023-12-08T11:33:53.634979452Z", "build_snapshot": false, "lucene_version": "9.8.0", "minimum_wire_compatibility_version": "7.17.0", "minimum_index_compatibility_version": "7.0.0" }, "tagline": "You Know, for Search" }</pre>																																								

Kibana- Introduction

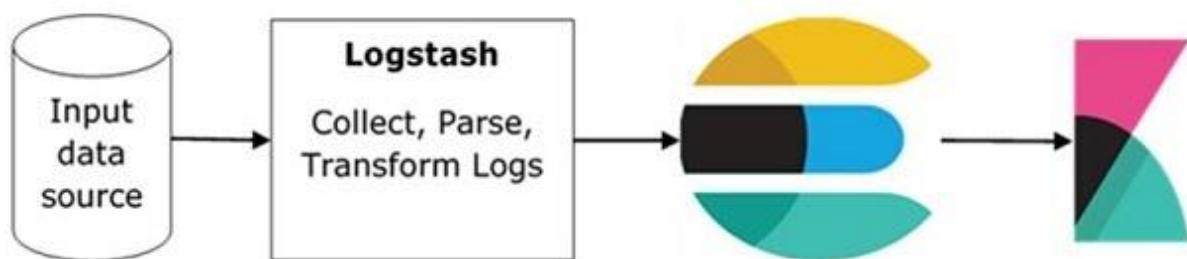

kibana

Kibana is an open source browser based visualization tool mainly used to analyse large volume of logs in the form of line graph, bar graph, pie charts , heat maps, region maps, coordinate maps, gauge, goals, timelines etc. The visualization makes it easy to predict or to see the changes in trends of errors or other significant events of the input source.Kibana works in sync with Elasticsearch and Logstash which together forms the so called ELK stack.

What is Kibana?

Kibana is a visualization tool, which accesses the logs from Elasticsearch and is able to display to the user in the form of line graph, bar graph, pie charts etc.

Implementation of Kibana

Download **Kibana ZIP** from the following official link:
<https://www.elastic.co/downloads/kibana>

Download Kibana

- 1 Download and unzip Kibana

Choose platform:

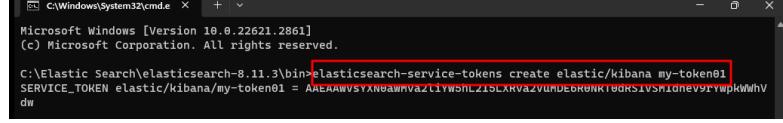

Windows

 Windows

 sha  asc

Unzip the folder in any of the drives.

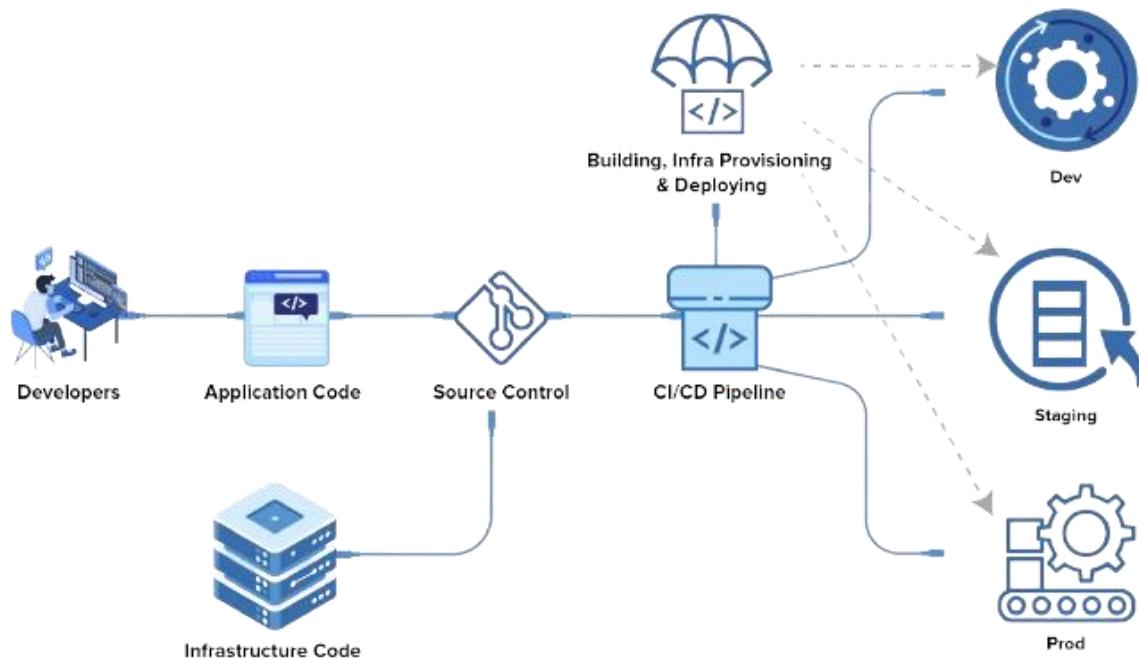

Name	Date modified	Type
bin	03-01-2024 13:18	File folder
config	03-01-2024 13:18	File folder
data	08-12-2023 16:42	File folder

Module 5: Automating Deployment with Infrastructure as Code (IaC)

The Infrastructure as Code (IaC) operations have modified how software developers develop, evaluate, and release applications by increasing the number of development and distribution cycles. To make infrastructure development and configuration more competitive and successful, reducing the costs and effort involved, automation tools that facilitate these activities are essential.

Principles of Infrastructure as Code (IaC)

- Easily recreate systems
- Disposable Systems
- Self-Documentation
- Design Is Always Changing
- Generic Modules
- A single, unified API for automated infrastructure deployment
- <https://www.xenonstack.com/insights/infrastructure-code-principles>

Features of IaC:

- **Automation:** IaC automates the provisioning and configuration of infrastructure, reducing manual errors and saving time.

- **Repeatability:** IAC scripts can be used repeatedly, making it easy to recreate the same infrastructure in multiple environments.
- **Version Control:** IAC code is stored in version control systems like Git, which makes it easy to track changes, revert to previous versions, and collaborate with others.
- **Scalability:** IAC makes it easy to scale infrastructure up or down, adding or removing resources as needed.
- **Transparency:** IAC makes the infrastructure transparent and understandable, as the code defines the infrastructure components and their relationships.
- **Improved Security:** IAC helps ensure that infrastructure is configured consistently and securely, reducing the risk of security vulnerabilities

Applications of IaC:

- Cloud computing
- DevOps
- Continuous integration and delivery (CI/CD)
- Networking
- Web application deployment
- Database deployment
- Big data

Git and Github

Git is a popular version control system. It was created by Linus Torvalds in 2005 and has been maintained by Junio Hamano since then.

It is used for:

- Tracking code changes
- Tracking who made changes
- Coding collaboration

What does Git do?

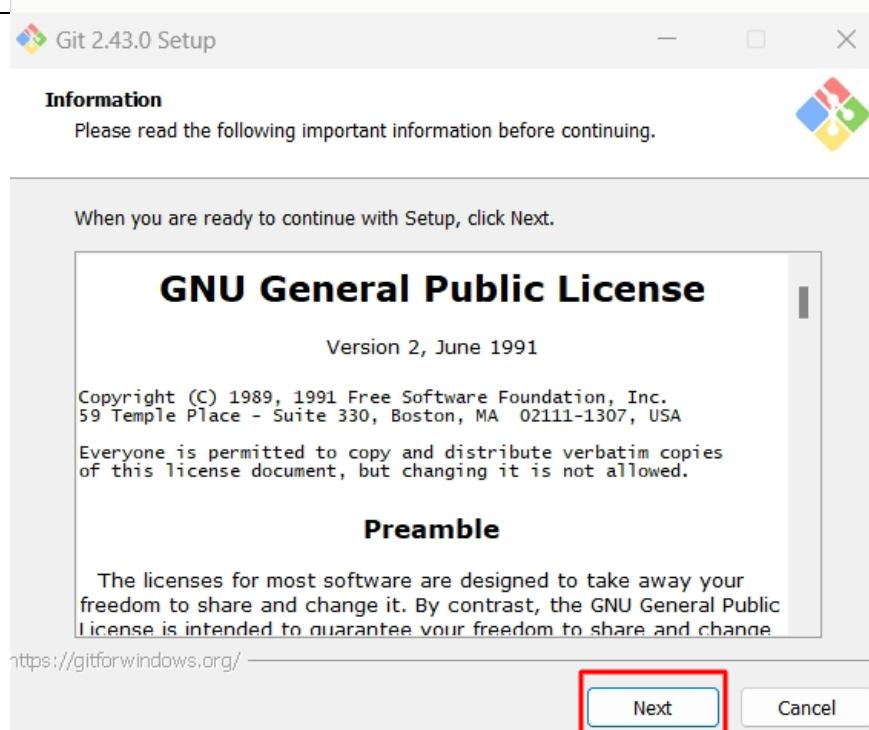

- Manage projects with **Repositories**
- **Clone** a project to work on a local copy
- Control and track changes with **Staging** and **Committing**
- **Branch** and **Merge** to allow for work on different parts and versions of a project
- **Pull** the latest version of the project to a local copy
- **Push** local updates to the main project

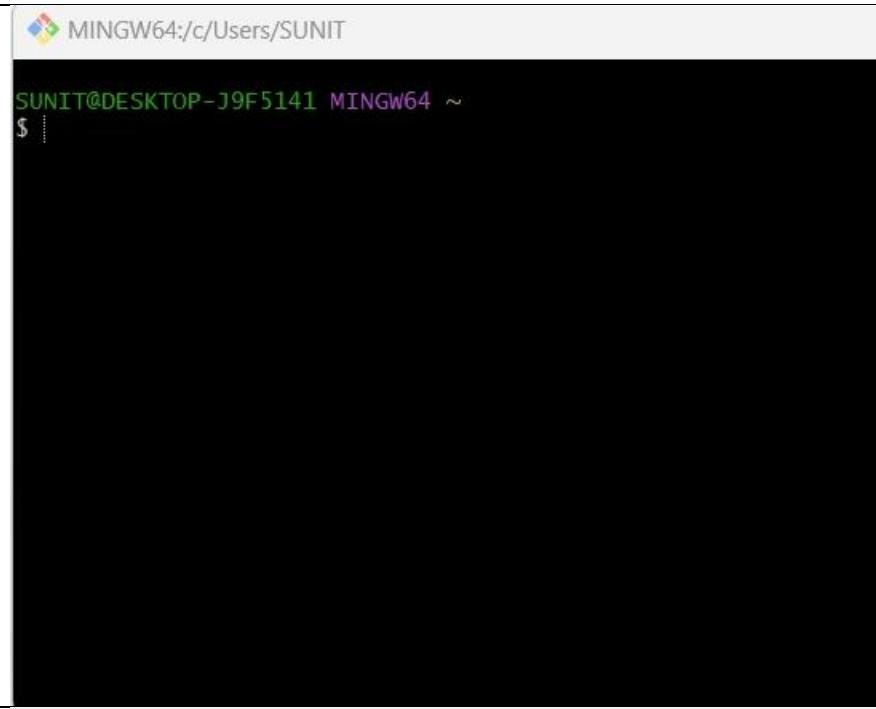

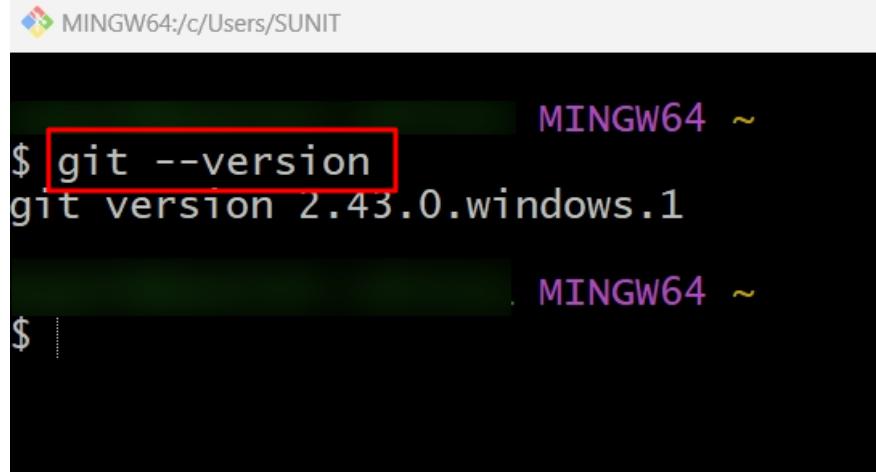

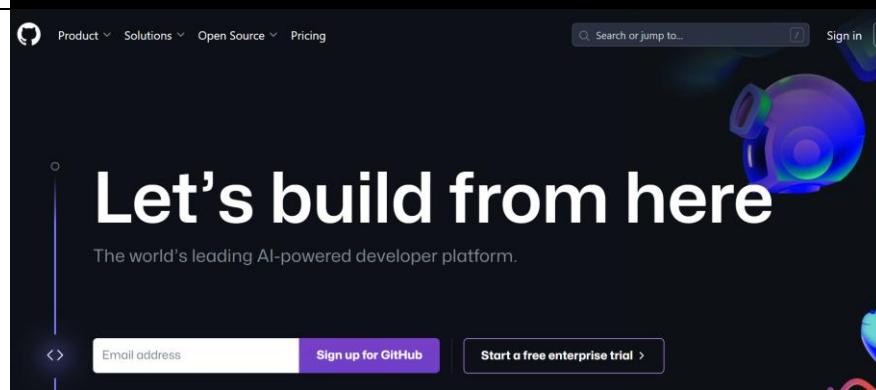

What is GitHub?

- Git is not the same as GitHub.
- GitHub makes tools that use Git.
- GitHub is the largest host of source code in the world, and has been owned by Microsoft since 2018.
- In this tutorial, we will focus on using Git with GitHub.

Learning Activity: Implementation of Git and GitHub

<p>Download the Git from the following URL: https://git-scm.com/downloads</p>	
<p>Now Select the OS according to the system.</p> <p>We are working on Windows so click on windows</p>	

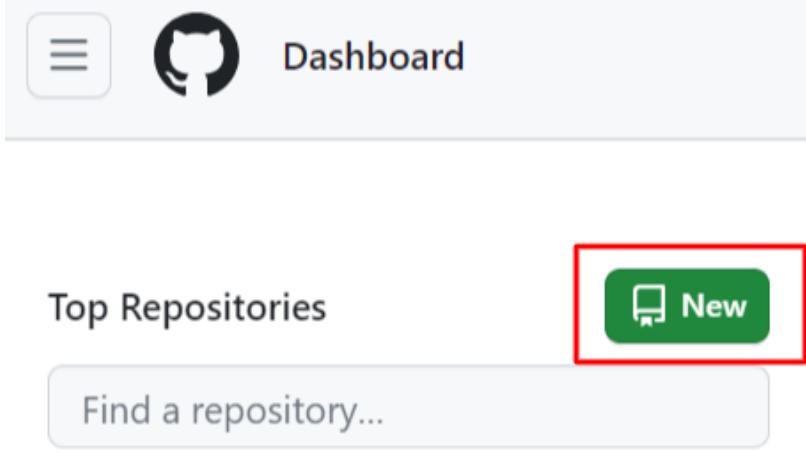

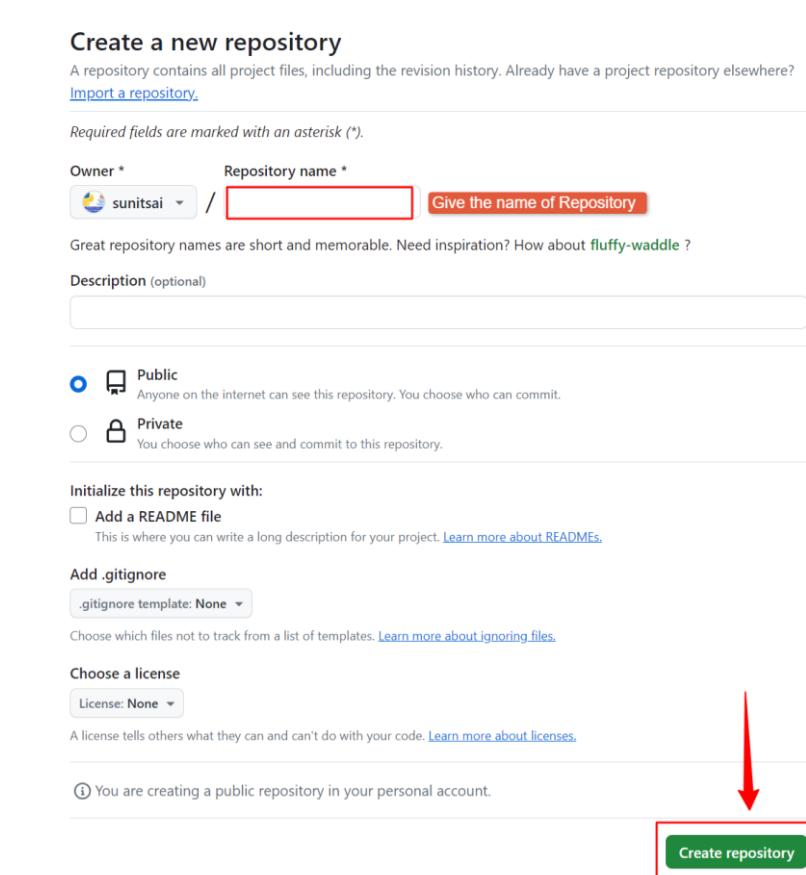

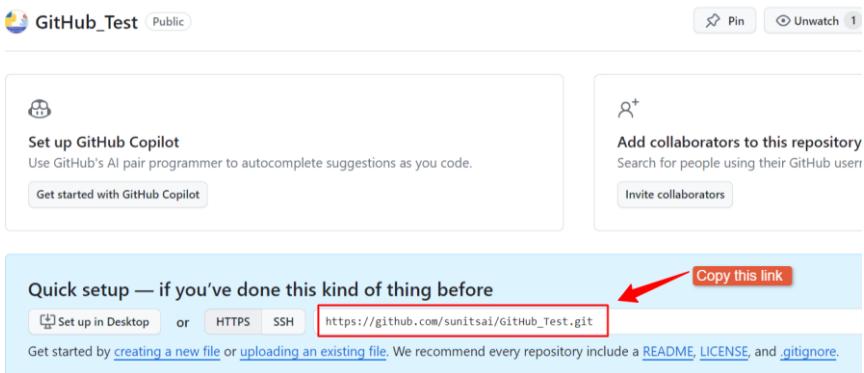

<p>Now select the installer setup</p>	<h2>Download for Windows</h2> <p>Click here to download the latest (2.43.0) 64-bit version of Git for Windows. It was released recently (about 1 month ago, on 2023-11-14).</p> <p>Other Git for Windows downloads</p> <ul style="list-style-type: none"> Standalone Installer 32-bit Git for Windows Setup. 64-bit Git for Windows Setup. 64-bit Git for Windows Setup. Portable ("thumbdrive edition") 32-bit Git for Windows Portable. 64-bit Git for Windows Portable.
<p>Now launch the setup of Git and follow the wizard just click on the Next button and keep the default settings only don't change any configurations.</p>	 <p>The screenshot shows the 'Information' step of the Git 2.43.0 Setup wizard. It displays the GNU General Public License text. A red box highlights the 'Next' button at the bottom right of the window.</p>

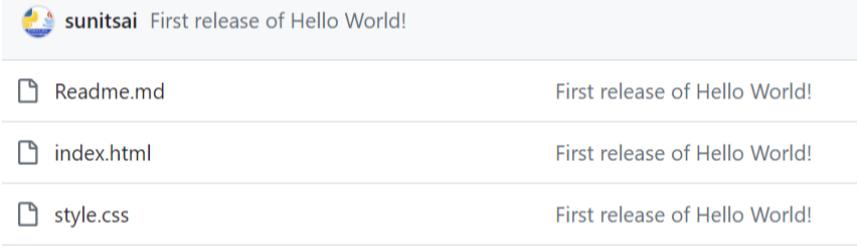

<p>Now open Git Bash after the installation is Complete.</p>	
<p>Now check the version of Git type the following command:</p> <pre>git --version</pre>	
<p>Now Open the GitHub follow the URL: https://github.com/</p>	

<p>Check the following things:</p> <p>New User: Click on Sign Up</p> <p>Existing User: Click on Sign In</p>	
<p>Now configure Git by using the following command:</p> <pre>git config --global user.name "username" git config --global user.email "your_email"</pre>	<pre>SUNIT@DESKTOP-J9F5141 MINGW64 ~ \$ git config --global user.name "██████████" SUNIT@DESKTOP-J9F5141 MINGW64 ~ \$ git config --global user.email "██████████" ██████████"</pre>
<p>Now, let's create a new folder for our project</p>	
<p>Now go inside the folder using Git bash</p>	
<p>Once you have navigated to the correct folder, you can initialize Git on that folder</p>	<pre>SUNIT@DESKTOP-J9F5141 MINGW64 \$ git init Initialized empty Git repository in</pre>
<p>For this example, I am going to use a simple HTML file like this</p>	<pre><!DOCTYPE html> <html> <head> <title>Hello World!</title> </head> <body> <h1>Hello world!</h1> <p>This is the first file in my new Git Repo.</p> </body> </html></pre>
<p>Let's go back to the terminal and list the files in our current working directory</p>	<pre>SUNIT@DESKTOP-J9F5141 MINGW64 \$ ls index.html</pre>

<p>Then we check the Git Status and see if it is a part of our repo</p>	<pre>SUNITT@DESKTOP-J9F5141 MINGW64 \$ git status On branch master No commits yet Untracked files: (use "git add <file>..." to include in what will be committed) index.html nothing added to commit but untracked files present (use "git a</pre>
<p>we are done working with index.html. So we can add it to the Staging Environment</p>	<pre>SUNIT@DESKTOP-J9F5141 MINGW64 \$ git add index.html</pre>
<p>The file should be Staged. Let's check the status.</p>	<pre>SUNIT@DESKTOP-J9F5141 MINGW64 \$ git status On branch master No commits yet Changes to be committed: (use "git rm --cached <file>..." to unstage) new file: index.html</pre>
<p>A Readme.md file that describes the repository</p>	 <pre>Welcome ↗ index.html A ⓘ Readme.md U X # style.css U ⓘ Readme.md > # hello-world 1 # hello-world 2 Hello World repository for Git 3 This is an example repository for the Git 4</pre>
<p>Now add CSS file in the folder.</p>	<pre># style.css > h1 1 body { 2 background-color: lightblue; 3 } 4 5 h1 { 6 color: navy; 7 margin-left: 20px; 8 }</pre>

Update the CSS link in index.html file	<pre> > index.html > html 1 <!DOCTYPE html> 2 <html> 3 <head> 4 <title>Hello World!</title> 5 <link rel="stylesheet" href="style.css"> 6 </head> 7 <body> 8 9 <h1>Hello world!</h1> 10 <p>This is the first file in my new Git Repo.</p> 11 12 </body> 13 </html></pre>
Now add all files in the current directory to the Staging Environment	<pre>SUNIT@DESKTOP-J9F5141 \$ git add --all</pre>
Then we check the Git Status and see if it is a part of our repo	<pre>SUNTT@DESKTOP-J9F5141 MINGW64 \$ git status On branch master No commits yet Changes to be committed: (use "git rm --cached <file> new file: Readme.md new file: index.html new file: style.css</pre>
Now commit the file into a repo.	<pre>SUNIT@DESKTOP-J9F5141 MINGW64 \$ git commit -m "First release of Hello World!" [master (root-commit) 2f6c324] First release of Hello World! 3 files changed, 24 insertions(+) create mode 100644 Readme.md create mode 100644 index.html create mode 100644 style.css</pre>

<p>Now open GitHub and click on New button to create a repository.</p>	
<p>Give the name of repository and click on create.</p>	
<p>Now copy the repository link.</p>	

<p>Open the Git Bash and let add the three file in our repository.</p> <p>To add the files in repository follow the figure.</p>	<pre>SUNIT@DESKTOP-J9F5141 MINGW64 \$ git remote add origin https://github.com/sunitsai/GitHub_Test.git Paste the repo link over here</pre>								
<p>Now to push the file into the repo.</p>	<pre>SUNTT@DESKTOP-J9F5141 MINGW64 \$ git push --set-upstream origin master Enumerating objects: 5, done. Counting objects: 100% (5/5), done. Delta compression using up to 8 threads Compressing objects: 100% (5/5), done. Writing objects: 100% (5/5), 596 bytes 596.00 KiB/s, done. Total 5 (delta 0), reused 0 (delta 0), pack-reused 0 To https://github.com/sunitsai/GitHub_Test.git * [new branch] master -> master branch 'master' set up to track 'origin/master'.</pre>								
<p>Now refresh the GitHub page and files will be uploaded there with the first commit.</p>	 <table border="1" data-bbox="484 841 1341 1088"> <tbody> <tr> <td> sunitsai</td> <td>First release of Hello World!</td> </tr> <tr> <td> Readme.md</td> <td>First release of Hello World!</td> </tr> <tr> <td> index.html</td> <td>First release of Hello World!</td> </tr> <tr> <td> style.css</td> <td>First release of Hello World!</td> </tr> </tbody> </table>	 sunitsai	First release of Hello World!	 Readme.md	First release of Hello World!	 index.html	First release of Hello World!	 style.css	First release of Hello World!
 sunitsai	First release of Hello World!								
 Readme.md	First release of Hello World!								
 index.html	First release of Hello World!								
 style.css	First release of Hello World!								

Module 6: Security and Compliance in CI/CD Pipelines

CI/CD Pipeline:

- A continuous integration and continuous delivery/deployment (CI/CD) pipeline is a series of steps that software delivery undergoes from code creation to deployment.
- CI/CD encompasses a series of automated processes — from code development to production deployment — that enable frequent and reliable delivery of code changes to the production environment. It forms the backbone of DevOps, a shift in software development that emphasizes collaboration between development and operations teams to ultimately shorten the development lifecycle without compromising software quality.

Integrating security practices into CI/CD pipelines:

- it's important to include security checks at various stages to ensure that your code is secure and compliant with security standards. There are a number of measures you can take to secure your CI/CD pipeline.

Planning phase:

- This stage involves gathering requirements and consumer input to develop a product roadmap. It also encompasses the best practices and policies for a successful DevOps strategy.
- You should also take advantage of threat modeling to help identify potential areas of attack and take steps to secure your pipeline. In threat modeling, security vulnerabilities are identified, and countermeasures are determined to mitigate them. By applying threat modeling to CI/CD pipelines, you can identify potential attack areas and take measures to secure them.
- Supply-chain Levels for Software Artifacts (SLSA) is also useful during the planning phase. This security framework comprises a checklist of standards and controls to prevent supply-chain attacks, safeguard against integrity challenges, and safeguard software packages and infrastructure in your organization.

Coding phase:

- In the coding phase, the developers write the necessary code to build the software. The code must be written by predefined standards and design guidelines.
- You should use source code scanners such as CAST Application Intelligence Platform (AIP) or CodeSecure to detect pieces of code that might be vulnerable to security threats.

Build phase:

- During the build phase, the developers are responsible for committing their source code to a shared repository. Once the code changes are checked into the repository, builds are triggered, and automated tests are executed to verify if the builds comply with the requirements.
- Here are some tips for setting up security checks in your CI/CD pipeline:

- Include a static code analysis tool in your build stage to check the code for common security vulnerabilities and compliance issues.
- Use Static application security testing (SAST) tools like SonarQube, Veracode, AppScan, or Codacy.
- Use software composition analysis (SCA) tools such as Veracode, Sonatype Nexus Platform, etc.
- Set up security-related test cases based on organization policies. These tests can check for things like cross-site scripting (XSS) and SQL injection flaws.
- Use a code-signing service to sign your code ahead of deploying the code to the production environment. This will help ensure that the code has not been tampered with and that it comes from a trusted source.

Testing phase:

- Once a build is successful, the software is tested to detect any potential bugs. If new features are added, a new build is generated and regression testing is performed on the new build to verify if the functional tests succeed.
- At this stage, you should run container scanning tools (e.g., Datadog, Clair, Anchore, and Qualys) or dynamic analysis security testing (DAST) tools (e.g., Netsparker and Acunetix)

Deployment phase:

- In this phase, the build is deployed to the production environment.

Monitoring Phase:

- During this phase, the build is monitored to ensure that it works as expected. The application deployed in the production environment is observed to evaluate performance and other aspects.

What is Vulnerability Scanning?

- Vulnerability scanning is performed to detect and remediate these vulnerabilities.
- Vulnerability scanning can be done either by the team or by automated software to manage different types of vulnerabilities. Automated vulnerability scanning is different from manual vulnerability scanning, in which a human examines an application or system and searches for vulnerabilities.

CI/CD Secrets Management:

- A continuous workflow calls for unique practices when it comes to managing vault secrets and privileged access. Secrets refer to user credentials, keys, passwords, private certificates, and anything else that is essential for software deployment and must be kept secret.
- Secrets can serve as authentication tools to prove the identity of a user or system or authorization, where access to certain corporate resources is granted based on user privileges.
- When working with CI/CD, organizations must use multiple services, environment repositories, cloud providers, and verification providers. Keeping accurate secrets for each team and each service can be a challenge when everyone needs a different level of access.

- Also, part of development is authenticating digital tools to get the most out of them. Any resources you use must have the right access to do their jobs, especially in hybrid cloud environments or automated tools like Kubernetes.
- All this complexity makes secrets management in a CI/CD environment expensive and error-prone if managed improperly. Because secrets are required for any CI/CD working environment, it's important to pick up some best practices.

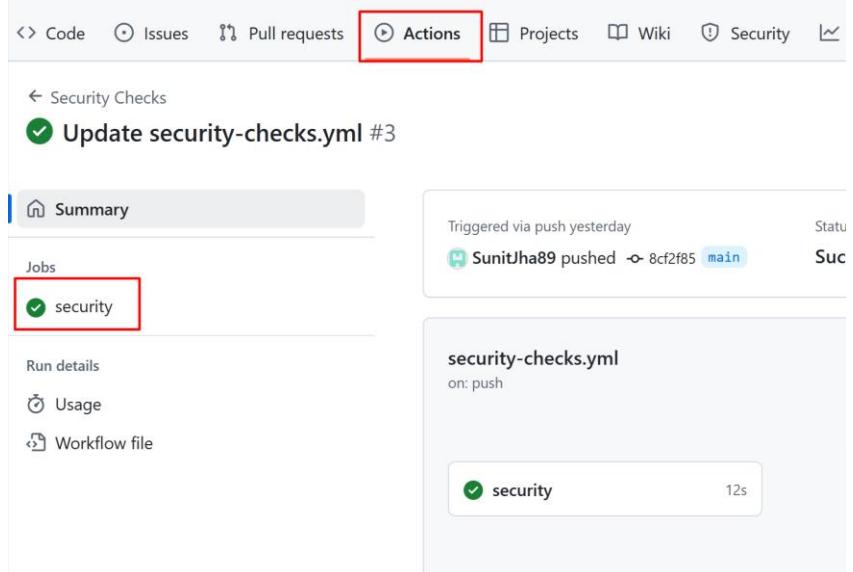

Learning Activity: Implementing automated security checks and vulnerability scans.

1. Create a repository name “Java-Security-Checks”.	<p>Create a new repository</p> <p>A repository contains all project files, including the revision history. Already have a project repository elsewhere? Import a repository.</p> <p>Required fields are marked with an asterisk (*).</p> <table border="0" style="width: 100%;"> <tr> <td style="width: 15%;">Owner *</td> <td style="width: 15%;">Repository name *</td> </tr> <tr> <td> SunitJha89</td> <td>/ <input style="border: 2px solid red; width: 100px; height: 25px; border-radius: 5px; padding: 2px 5px;" type="text" value="java-security-check"/></td> </tr> <tr> <td colspan="2" style="text-align: center;"> <input checked="" type="checkbox"/> java-security-check is available. </td> </tr> </table> <p>Great repository names are short and memorable. Need inspiration? How about legendary-computing-machine ?</p> <p>Description (optional)</p> <div style="border: 1px solid #ccc; width: 100%; height: 40px; margin-top: 5px;"></div>	Owner *	Repository name *	 SunitJha89	/ <input style="border: 2px solid red; width: 100px; height: 25px; border-radius: 5px; padding: 2px 5px;" type="text" value="java-security-check"/>	<input checked="" type="checkbox"/> java-security-check is available.	
Owner *	Repository name *						
 SunitJha89	/ <input style="border: 2px solid red; width: 100px; height: 25px; border-radius: 5px; padding: 2px 5px;" type="text" value="java-security-check"/>						
<input checked="" type="checkbox"/> java-security-check is available.							
2. Create a “HelloWorld.java” file.	<pre>public class HelloWorld { public static void main(String[] args) { System.out.println("Hello, World!"); } }</pre>						
3. Upload the java file in GitHub repository.	<p> java-security-check <small>Public</small></p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> Start coding with Codespaces</p> <p>Add a README file and start coding in a secure, configurable, and dedicated development environment.</p> <p>Create a codespace</p> </div> <div style="background-color: #e1f5fe; padding: 10px; margin-top: 20px;"> <p>Quick setup — if you've done this kind of thing before</p> <p> Set up in Desktop or HTTPS SSH https://github.com/SunitJha89/java-security-ch</p> <p>Get started by creating a new file or uploading an existing file. We recommend every repository inclu</p> </div>						

4. Click on Action and then click on “Set Up a Workflow Yourself” for creating a yml file.	<p>/ java-security-check</p> <p>Pull requests Actions Projects Wiki Security Insights</p> <h2>Get started with GitHub Actions</h2> <p>Build, test, and deploy your code. Make code reviews, branch management, and issue tr</p> <p>Skip this and set up a workflow yourself →</p> <p>Search workflows</p>
5. Give the name of YML file.	<p>SunitJha89 / java-security-check</p> <p>Code Issues Pull requests Actions Projects Wiki</p> <p>security-check / .github / workflows / security-checks.yml in main</p> <p>it Preview</p> <p>Enter file contents here</p>
6. Write a Workflow in file name “security-checks.yml”	<pre> name: Security Checks on: push: branches: - main pull_request: branches: - main jobs: security: runs-on: ubuntu-latest steps: - name: Checkout code uses: actions/checkout@v3 - name: Set up JDK 11 uses: actions/setup-java@v3 with: distribution: 'adopt' java-version: '11' - name: Run Security Scan </pre>

	<pre> run: curl -LO https://github.com/jeremylong/DependencyCheck/releases/ download/v6.5.3/dependency-check-6.5.3-release.zip unzip dependency-check-6.5.3-release.zip ./dependency-check/bin/dependency-check.sh -- project JavaSecurityCheck --scan ./ --format HTML --out report --disableAssembly -v - name: Upload Report uses: actions/upload-artifact@v3 with: name: security-report path: report </pre>
7. Commit the workflow file in main branch.	<p>Commit changes X</p> <hr/> <p>Commit message</p> <div style="border: 1px solid #ccc; padding: 5px; width: 100%;">Create security-checks.yml</div> <hr/> <p>Extended description</p> <div style="border: 1px solid #ccc; padding: 10px; min-height: 100px;">Add an optional extended description..</div> <hr/> <div style="text-align: right;"> Cancel Commit changes </div>

8. Check the workflow by clicking on action button.

The screenshot shows the GitHub Actions interface for a repository named "MySecureProject". The "Actions" tab is selected. A green checkmark icon next to "Update security-checks.yml #3" indicates success. In the "Jobs" section, there is one job named "security" which is also marked with a green checkmark and has a status of "Success". The duration of the run was 12s. The workflow file "security-checks.yml" is shown to have triggered via a push yesterday, with a commit from "SunitJha89" pushed to the "main" branch.

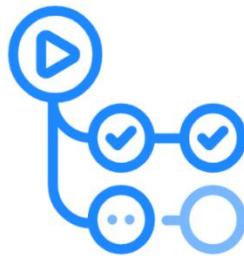

9. Now check the security check done by github action.

The screenshot shows the GitHub Actions interface for the same repository "MySecureProject". The "Actions" tab is selected. A green checkmark icon next to "Update security-checks.yml #3" indicates the workflow is in progress. In the "Jobs" section, there is one job named "security" which is marked with a grey circle and has a status of "Queued". The workflow file "security-checks.yml" is shown to have triggered via a push. The interface includes a search bar and various navigation buttons at the bottom.

Module 7: Hands-on Workshop: Building and Managing CI/CD Pipelines

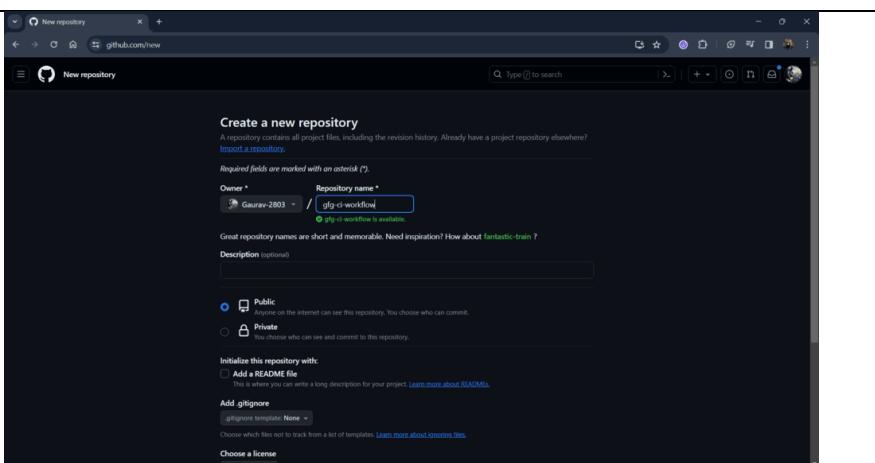

Collaborative exercises: designing, building, and managing CI/CD pipelines.

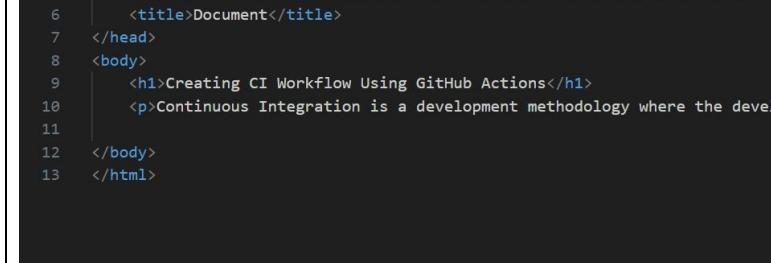

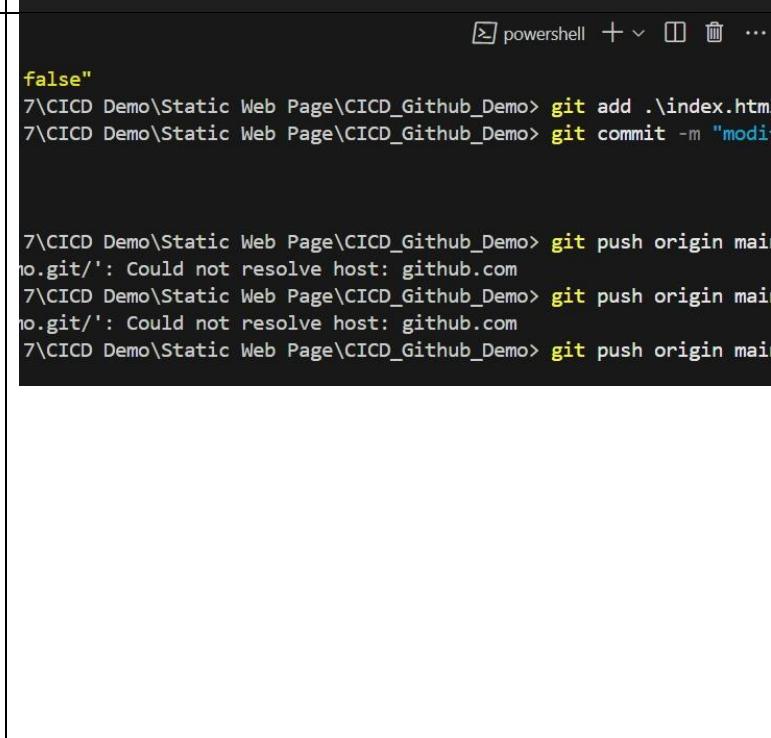

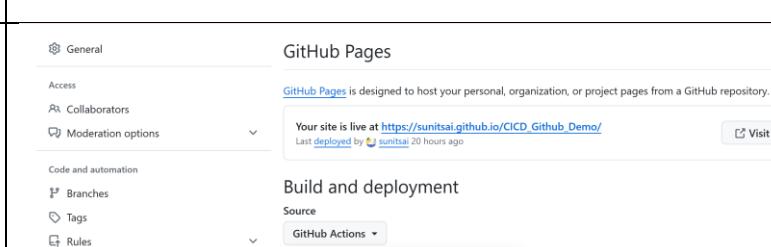

GitHub Actions

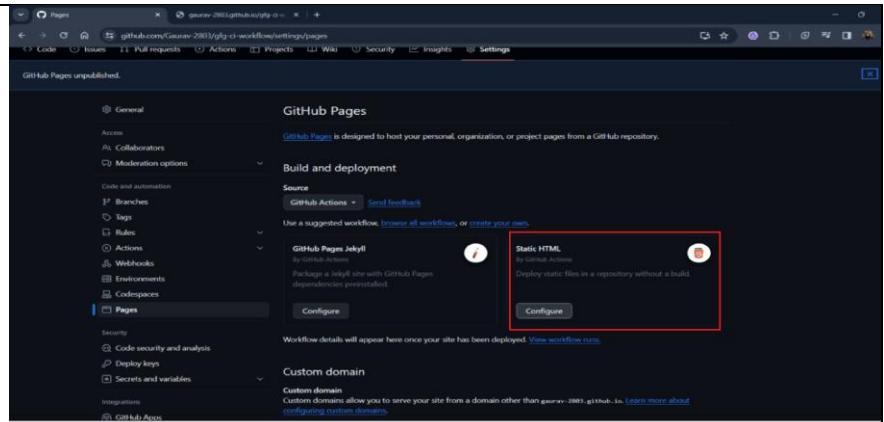

GitHub Actions is a continuous integration and continuous delivery (CI/CD) feature provided by GitHub that allows you to automate your build, test, and deployment pipeline whenever any changes happen in your repo.

Learning Activity: Creating CI Workflow Using GitHub Actions: A Step-By-Step Guide

1. Create an Empty GitHub Repository.	
---------------------------------------	--

<p>2. Open your project in any text editor. Here I'm taking basic static HTML file with 1 heading and 1 paragraph. You can take anything.</p>	 <pre> <!DOCTYPE html> <html lang="en"> <head> <meta charset="UTF-8"> <meta name="viewport" content="width=device-width, initial-scale=1.0"> <title>Document</title> </head> <body> <h1>Creating CI Workflow Using GitHub Actions</h1> <p>Continuous Integration is a development methodology where the developers </p> </body> </html> </pre>
<p>3. Open Git terminal and Push your project on the GitHub Repository using following steps.</p> <ul style="list-style-type: none"> • Initialize empty Git repo using git init • Add files to staging area using git add . • Commit your changes using git commit -m "your message" • Create remote origin using git remote add origin "repo link" • Push the project using git push -u origin main 	 <pre> powershell + ... x false 7\CICD Demo\Static Web Page\CICD_Github_Demo> git add .\index.html 7\CICD Demo\Static Web Page\CICD_Github_Demo> git commit -m "modify index.html" 7\CICD Demo\Static Web Page\CICD_Github_Demo> git push origin main �.git/: Could not resolve host: github.com 7\CICD Demo\Static Web Page\CICD_Github_Demo> git push origin main �.git/: Could not resolve host: github.com 7\CICD Demo\Static Web Page\CICD_Github_Demo> git push origin main </pre>
<p>4. Open the settings of your repository and go to Pages. From the source select GitHub Actions.</p>	 <p>The screenshot shows the GitHub repository settings page for 'CICD_Github_Demo'. The 'General' tab is selected. Under 'GitHub Pages', it says 'Your site is live at https://sunitsai.github.io/CICD_Github_Demo/'. In the 'Build and deployment' section, under 'Source', 'GitHub Actions' is selected. A red box highlights this selection. Below it, there's a note: 'Best for using frameworks and customizing your build process'. Other options like 'Deploy from a branch' and 'Classic Pages experience' are also shown.</p>

5. Configure a **Static HTML**. This will generate a pre-build workflow for your static HTML file. GitHub provides in-built workflow, for my purposes I'll select static HTML you can choose yours respective workflow.

The screenshot shows the GitHub Pages settings page. Under the "Build and deployment" section, there are two options: "GitHub Pages Jekyll" and "Static HTML". The "Static HTML" option is highlighted with a red box. Below it is a "Configure" button.

6. The following image is the workflow **YAML file** that will automate your process of deployment.

```
main -> CICD_Github_Demo/.github/workflows/static.yml
Blame 43 lines (38 loc) · 1.22 KB Code 55% faster with GitHub Copilot

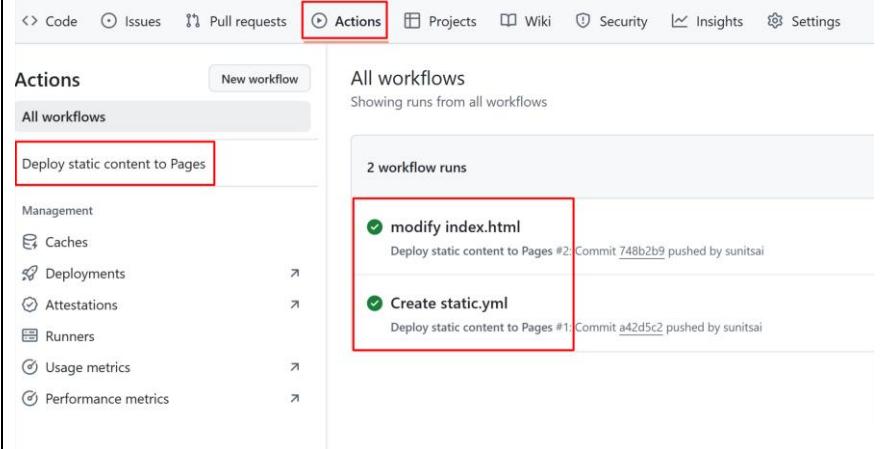

# Runs on pushes targeting the default branch
push:
  branches: ["main"]

# Allows you to run this workflow manually from the Actions tab
workflow_dispatch:

# Sets permissions of the GITHUB_TOKEN to allow deployment to GitHub Pages
permissions:
  contents: read
  pages: write
  id-token: write

# Allow only one concurrent deployment, skipping runs queued between the run in-progress and latest queued.
# However, do NOT cancel in-progress runs as we want to allow these production deployments to complete.
concurrency:
  group: "pages"
  cancel-in-progress: false

jobs:
  # Single deploy job since we're just deploying
  deploy:
    environment:
      name: github-pages
      url: ${{ steps.deployment.outputs.page_url }}
    runs-on: ubuntu-latest
    steps:
      - name: Checkout
        uses: actions/checkout@v4
      - name: Setup Pages
        uses: actions/configure-pages@v5
      - name: Upload artifact
        uses: actions/upload-pages-artifact@v3
        with:
          # Upload entire repository
          path: '.'
      - name: Deploy to GitHub Pages
        id: deployment
        uses: actions/deploy-pages@v4
```

<p>7. From the above repo tabs go to Actions and check if your app is deployed on Github Pages or not.</p>	 <p>The screenshot shows the GitHub Actions interface. The 'Actions' tab is selected. Under 'All workflows', there are two workflow runs listed: 'modify index.html' and 'Create static.yml'. Both runs show a green checkmark and indicate they deployed static content to Pages. The 'Create static.yml' run was triggered by a commit pushed by sunitsai.</p>
<p>8. Go to the link provided by GitHub this is where your HTML file is deployed.</p>	<p>static.yml on: push</p>  <p>A status card for a deployment step. It shows a green checkmark icon, the word 'deploy', and a duration of '13s'. Below the card is a red box highlighting a blue link: https://sunitsai.github.io/CICD_Github_De....</p>
<p>9. After opening the link you can see the contents of your HTML file.</p>	<h2>Creating CI Workflow Using GitHub Actions</h2> <p>Continuous Integration is a development methodology where the developers commit changes to source code frequently, and the build, test, and deployment processes are automated to detect errors early and quickly.</p>

<p>10. Now let's check if CI workflow or not. First, pull your changes.</p> <ul style="list-style-type: none"> • Modify your code and push it on the GitHub. • For every push our workflow will be generated and changes will reflect on your page. 	<pre>Total 3 (delta 0), reused 0 (delta 0), pack-reused 0 (from 0) To https://github.com/sunitsai/CICD_Github_Demo.git * [new branch] main -> main PS D:\Xaltius\New\Material\NTUC\NATIVE\DevOps Introduction\Lesson 7\CICD Demo\Static Web Page\CICD_Github_Demo: git pull origin main remote: Enumerating objects: 9, done. remote: Counting objects: 100% (9/9), done. remote: Compressing objects: 100% (6/6), done. remote: Total 8 (delta 0), reused 0 (delta 0), pack-reused 0 (from 0) Unpacking objects: 100% (8/8), 2.56 KiB 138.00 KiB/s, done. The new changes will appear on the site.</p>	<h2>Creating CI Workflow Using GitHub Actions</h2> <p>Continuous Integration is a development methodology where the developers commit changes to source code</p> <h3>What Are Github Actions?</h3> <p>GitHub Actions is a platform built into GitHub that automates all the SDLC steps like development, testing,</p>

Applying best practices for testing, deployment, and monitoring

- **Prioritize security, testing, and time to release:** Before configuring your CI/CD pipeline, prioritize security, testing, and time to release. This determines how you approach each step in your pipeline. For example, if security is a top priority, you can implement more controls on your code before it's deployed.

- **Test code in the early stages:**

You can catch bugs and identify issues at different testing stages. For example, if developers find a problem on their local machine, they can fix issues in the staging environment before moving the code to production.

- **Identify tests that can be automated:**

Any test that doesn't require human interaction should be automated and integrated into the pipeline as a rule of thumb. You should adopt an "automate everything" mindset but also understand not all tests can be automated.

- **Commit daily:**

High-performing teams can commit to their repository once a day. This requires extensive automation to ensure high quality with each new version, but it's well worth the effort.

- **Choose tools that support your priorities:**

When choosing DevOps tools, consider what matters most to you as a developer and business analyst. Do you heavily focus on infrastructure automation? Does an application lifecycle management (ALM) methodology drive your work? Do you manage multiple virtual machines? Consider vendor options designed explicitly for CI/CD operations to address these fundamental concerns.

- **See if you're ready to adopt a microservices architecture:**

Microservices architecture is a way to structure software applications so that each component functions, updates, and scales independently.

- **Use on-demand testing environments:**

The ease of creating a new testing environment at the click of a button helps run tests as early and often as possible. As a result, developers can make the most of their time knowing they'll complete their work quickly.

- **Involve the whole team in the CI/CD implementation:**

Involving each team member in the CI/CD process is critical to CI/CD implementation. CI/CD isn't technical; it's cultural. Make it clear that CI/CD isn't just a technical step but an essential part of the company culture to seek active participation in the process.

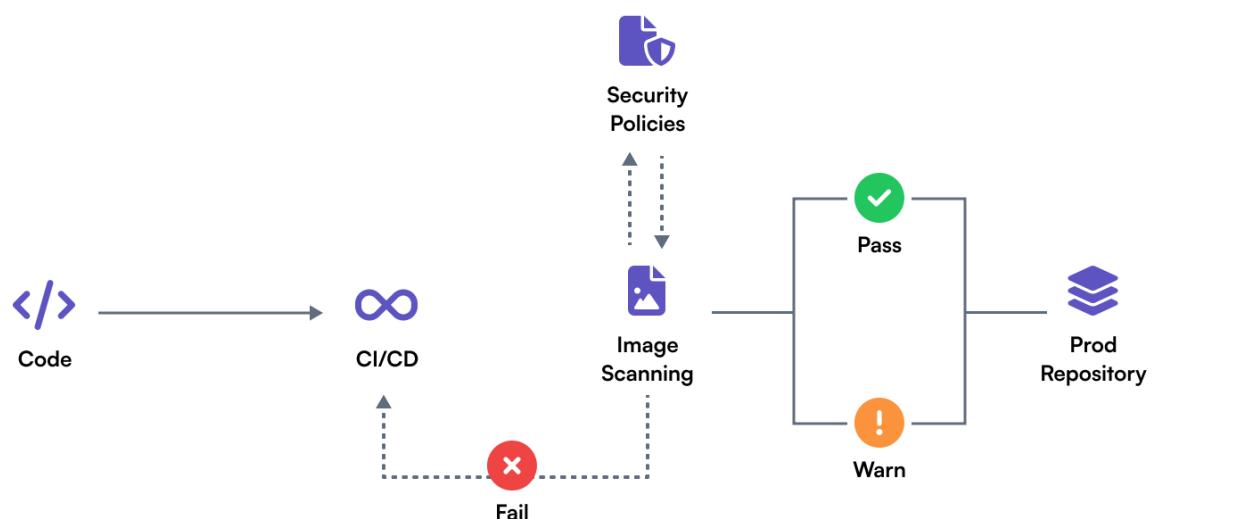

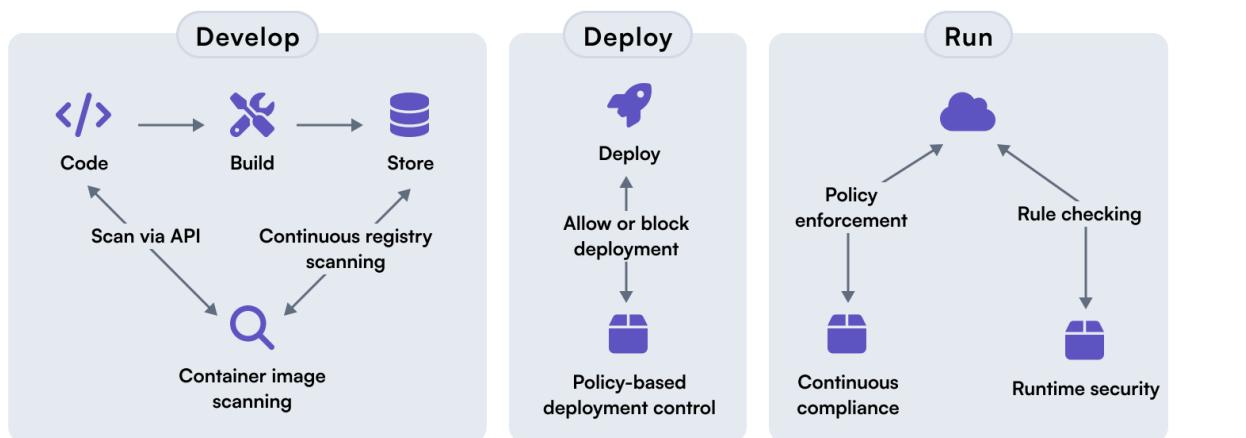

Integrating security and compliance checks into the pipeline.

Choosing the right security tools is pivotal for effective integration into the CI/CD pipeline. The selection should be based on the technology stack, development environment, and specific security requirements of the project.

Consider the following when selecting security tools:

- Compatibility: Ensure the tools integrate seamlessly with the existing CI/CD infrastructure.
- Comprehensiveness: Select tools that cover a wide range of security aspects, from code analysis to runtime protection.
- Usability: Tools should be user-friendly, providing clear insights and actionable recommendations.
- Performance: Evaluate the impact on build and deployment times to maintain efficiency

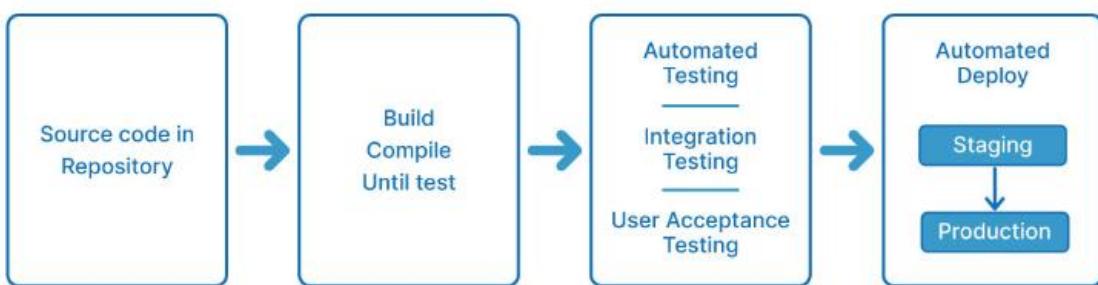

Container Security

Module 8: Use Cases: Successful CI/CD and Continuous Monitoring Implementations

Analyzing real-world use cases of successful CI/CD and monitoring implementations:

CI/CD PIPELINE

CI/CD pipelines real-life example:

There are many big giant companies nowadays implementing DevOps. Netflix and Facebook are the prime examples that have successfully implemented CI/CD pipelines to deliver software updates and features quickly and with high quality. Netflix uses a custom-built platform called Spinnaker to manage its CI/CD pipelines. Spinnaker allows Netflix to deploy code changes to production environments in minutes rather than hours or days.

Case Study 1: Accelerating Software Delivery with Continuous Integration:

- **Background:**

The case study begins with a well-established e-commerce company facing a common challenge in the digital era: the need to innovate and deliver new features and updates to its online store rapidly. In a highly competitive market, speed to market and agility were critical factors that could set them apart from their competitors. However, their existing software development process was plagued by slow manual testing and deployment procedures, leading to delays in delivering new features and bug fixes to customers.

Identifying scenarios where CI/CD and monitoring practices excel.

Scenario: Organizing a School Science Fair:

The class is creating an Excel sheet to organize the science fair participants, their projects, and scores from judges. Everyone works together to keep the sheet updated and error-free. CI/CD helps them automate some of the work.

Learning Activity: CI/CD Pipeline using Excel:

1. Create one Excel File name "ScienceFair.xlsx"	<table border="1"> <thead> <tr> <th>Student Name</th><th>Project Title</th><th>Judge 1 Score</th><th>Judge 2 Score</th><th>Average Score</th></tr> </thead> <tbody> <tr> <td>Alex Smith</td><td>Solar Power Car</td><td>8</td><td>9</td><td>8.5</td></tr> <tr> <td>Emma Johnson</td><td>Volcano Experiment</td><td>10</td><td>7</td><td>8.5</td></tr> <tr> <td>Liam Brown</td><td>Water Purification</td><td>6</td><td>5</td><td>5.5</td></tr> <tr> <td>Olivia Garcia</td><td>Growing Plants Faster</td><td>9</td><td>8</td><td>8.5</td></tr> <tr> <td>Ava Martinez</td><td>Balloon Rocket Race</td><td>10</td><td>10</td><td>10</td></tr> <tr> <td></td><td>Simple Machine Project</td><td>7</td><td>9</td><td></td></tr> <tr> <td>Sunit</td><td></td><td>9</td><td>8</td><td></td></tr> </tbody> </table>	Student Name	Project Title	Judge 1 Score	Judge 2 Score	Average Score	Alex Smith	Solar Power Car	8	9	8.5	Emma Johnson	Volcano Experiment	10	7	8.5	Liam Brown	Water Purification	6	5	5.5	Olivia Garcia	Growing Plants Faster	9	8	8.5	Ava Martinez	Balloon Rocket Race	10	10	10		Simple Machine Project	7	9		Sunit		9	8	
Student Name	Project Title	Judge 1 Score	Judge 2 Score	Average Score																																					
Alex Smith	Solar Power Car	8	9	8.5																																					
Emma Johnson	Volcano Experiment	10	7	8.5																																					
Liam Brown	Water Purification	6	5	5.5																																					
Olivia Garcia	Growing Plants Faster	9	8	8.5																																					
Ava Martinez	Balloon Rocket Race	10	10	10																																					
	Simple Machine Project	7	9																																						
Sunit		9	8																																						
2. Create a Java Maven Project and add dependency in "pom.xml"	<pre><dependency> <groupId>org.apache.poi</groupId> <artifactId>poi-ooxml</artifactId> <version>5.2.3</version> <!-- Check for the latest version -- -> </dependency></pre>																																								

<p>3. Create a “ExcelMonitor.java” file and write the following code.</p>	<pre> package ScienceFair.ScienceFair; import java.io.FileInputStream; import java.io.IOException; import org.apache.poi.ss.usermodel.Cell; import org.apache.poi.ss.usermodel.CellType; import org.apache.poi.ss.usermodel.Row; import org.apache.poi.ss.usermodel.Sheet; import org.apache.poi.ss.usermodel.Workbook; import org.apache.poi.xssf.usermodel.XSSFWorkbook; public class ExcelMonitor { public static void main(String[] args) { String filePath = "D:\\Xaltius(New)\\Material\\NTUC\\CNATIVE\\DevOps Introduction\\ScienceFair.xlsx"; // Path to the Excel file try (FileInputStream fis = new FileInputStream(filePath); Workbook workbook = new XSSFWorkbook(fis)) { Sheet sheet = workbook.getSheetAt(0); // Assume the first sheet boolean errorsFound = false; // Iterate over rows (skip the header row) for (int i = 1; i <= sheet.getLastRowNum(); i++) { Row row = sheet.getRow(i); if (row == null) continue; // Skip empty rows Cell nameCell = row.getCell(0); Cell projectCell = row.getCell(1); Cell judge1Cell = row.getCell(2); Cell judge2Cell = row.getCell(3); Cell avgCell = row.getCell(4); // Check for missing data if (isEmpty(nameCell) isEmpty(projectCell)) { System.out.println("Row " + (i + 1) + ": Missing student name or project title."); errorsFound = true; } // Check score validity double judge1 = getCellNumericValue(judge1Cell); double judge2 = getCellNumericValue(judge2Cell); } } } } </pre>
---	---

```

        if (judge1 < 0 || judge1 > 10) {
            System.out.println("Row " + (i + 1) + ": Judge 1
score is out of range.");
            errorsFound = true;
        }
        if (judge2 < 0 || judge2 > 10) {
            System.out.println("Row " + (i + 1) + ": Judge 2
score is out of range.");
            errorsFound = true;
        }

        // Check average score calculation
        if (!isCellEmpty(avgCell) && judge1 >= 0 && judge2
>= 0) {
            double correctAvg = Math.round((judge1 + judge2)
/ 2 * 10.0) / 10.0;
            double avg = getCellNumericValue(avgCell);
            if (avg != correctAvg) {
                System.out.println("Row " + (i + 1) + ": Incorrect
average score. Expected: " + correctAvg);
                errorsFound = true;
            }
        }
    }

    if (!errorsFound) {
        System.out.println("All data is correct!");
    }

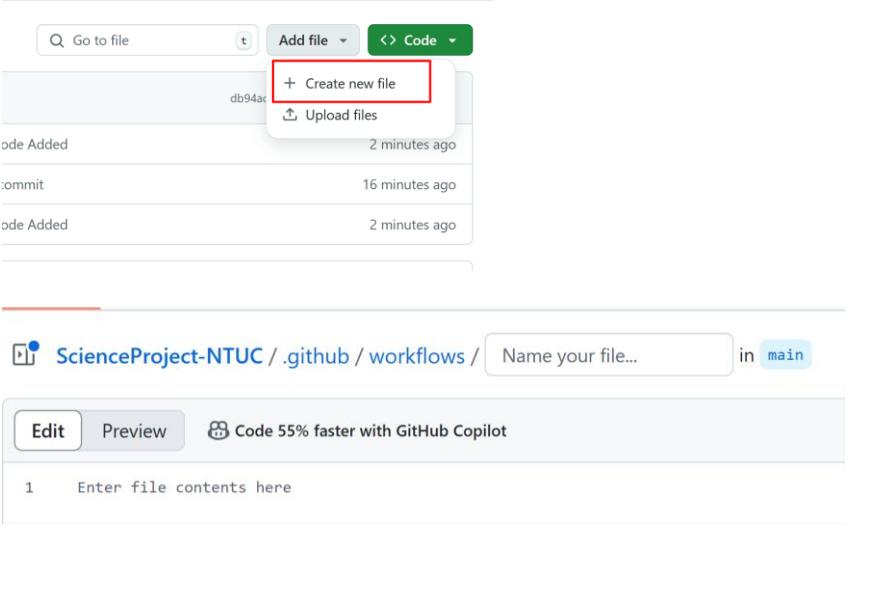

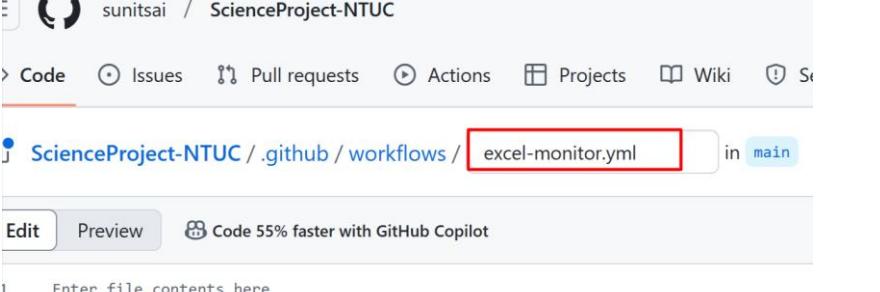

} catch (IOException e) {
    System.err.println("Error reading the Excel file: " +
e.getMessage());
}
}

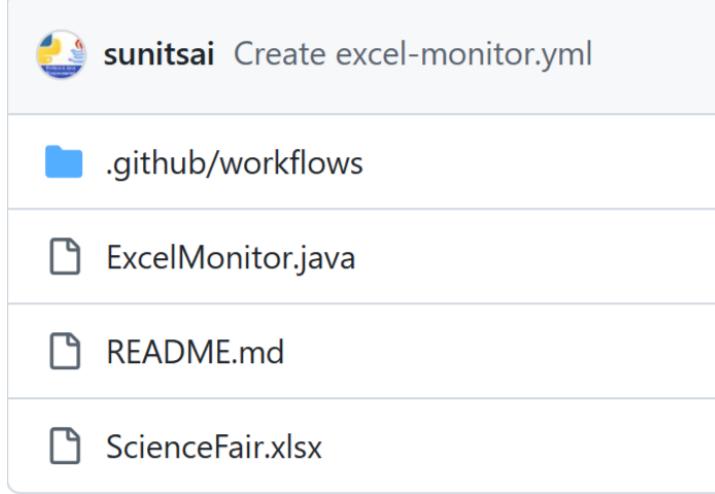

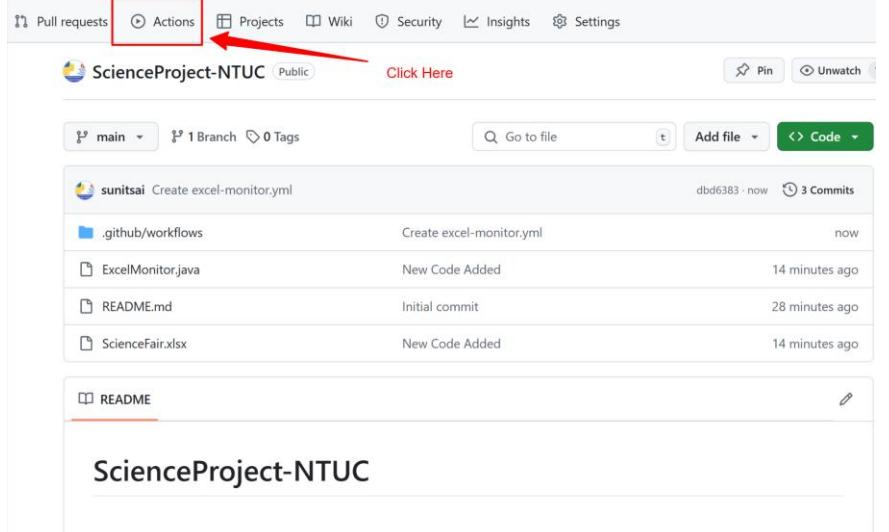

private static boolean isCellEmpty(Cell cell) {
    return cell == null || cell.getCellType() == CellType.BLANK;
}

private static double getCellNumericValue(Cell cell) {
    if (cell == null || cell.getCellType() != CellType.NUMERIC) {
        return -1; // Return -1 to indicate invalid or missing
numeric data
    }
    return cell.getNumericCellValue();
}
}

```

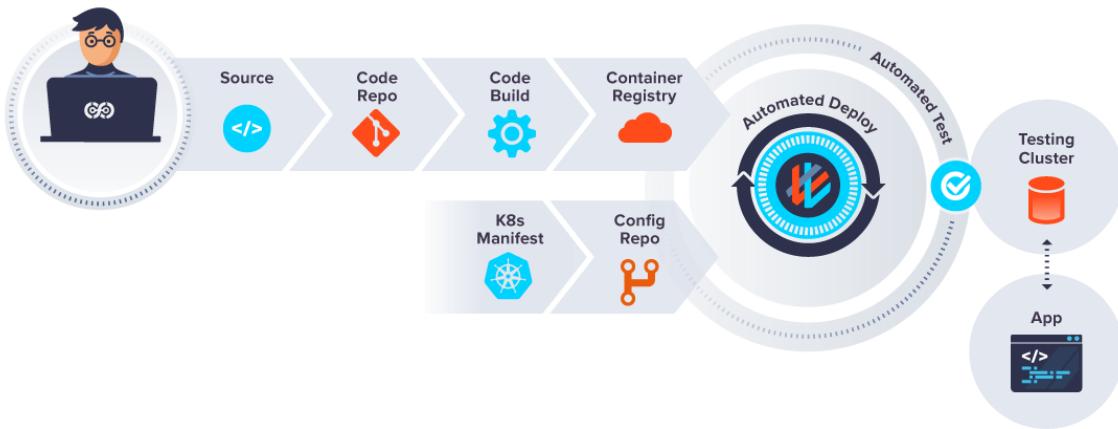

4. Save the provided Excel data (ScienceFair.xlsx) in the project folder.	
5. Compile Program	javac -cp poi-ooxml-5.2.3.jar:. ExcelMonitor.java
6. Run Program	java -cp poi-ooxml-5.2.3.jar:. ExcelMonitor
7. Set Up a GitHub Repository <ul style="list-style-type: none"> Create a free GitHub account if you don't have one. 	<p>Create a new repository</p> <p>A repository contains all project files, including the revision history. Already have a project repository elsewhere? Import a repository.</p> <p>Required fields are marked with an asterisk (*).</p> <p>Owner * Repository name *</p> <p> sunitsai / <input type="text"/></p> <p>Great repository names are short and memorable. Need inspiration? How about automatic-funicular ?</p> <p>Description (optional)</p> <p><input type="text"/></p> <p><input checked="" type="radio"/>  Public Anyone on the internet can see this repository. You choose who can commit.</p> <p><input type="radio"/>  Private You choose who can see and commit to this repository.</p> <p>Initialize this repository with:</p> <p><input type="checkbox"/> Add a README file This is where you can write a long description for your project. Learn more about READMEs.</p> <p>Add .gitignore</p> <p><input type="button" value=".gitignore template: None"/></p> <p>Choose which files not to track from a list of templates. Learn more about ignoring files.</p> <p>Choose a license</p> <p><input type="button" value="License: None"/></p> <p>A license tells others what they can and can't do with your code. Learn more about licenses.</p> <p> You are creating a public repository in your personal account.</p> <p><input type="button" value="Create repository"/></p>
8. Clone Repository by using git command.	<pre>PS D:\Xaltius(New)\Material\NTUC\CNATIVE\DevOps Introduction\Java CICD> git init Reinitializing existing Git repository in D:\Xaltius(New)\Material\NTUC\CNATIVE\DevOps Introduction\Java CICD>.git/ PS D:\Xaltius(New)\Material\NTUC\CNATIVE\DevOps Introduction\Java CICD> git clone https://github.com/sunitsai/ScienceProject-NTUC.git Cloning into 'ScienceProject-NTUC'... remote: Enumerating objects: 3, done. remote: Counting objects: 100% (3/3), done. remote: Total 3 (delta 0), reused 0 (delta 0), pack-reused 0 (from 0) Receiving objects: 100% (3/3), done. PS D:\Xaltius(New)\Material\NTUC\CNATIVE\DevOps Introduction\Java CICD> </pre>
9. Add the “ExcelMonitor.java” and “ScienceFair.xlsx” file in repository.	Git add .
10. Commit the file with the comments in repository.	Git commit -m “Comment”

11. Push the file in repository.	Git push origin main
12. Now add the new folder in repository by using github browser. Follow the following steps.	 <p>The screenshot shows a GitHub repository page for 'ScienceProject-NTUC'. In the top right corner, there is a 'Code' button with a dropdown arrow. A dropdown menu is open, showing options like 'Create new file' and 'Upload files'. The 'Create new file' option is highlighted with a red box. Below the dropdown, there is a list of recent commits and file additions. At the bottom of the page, there is a text input field for creating a new file named 'main'.</p>
13. Create a file named "excel-monitor.yml"	 <p>The screenshot shows the same GitHub repository page. The user has navigated to the '.github/workflows' directory. A file named 'excel-monitor.yml' is visible in the list. The file name is highlighted with a red box. Below the file list, there is an 'Edit' button and a text input field for entering file contents.</p>
14. Paste the following code in "excel-monitor.yml" file.	<pre> name: Excel File Validator on: push: paths: - science_fair.xlsx jobs: validate_excel: runs-on: ubuntu-latest steps: - name: Checkout Code uses: actions/checkout@v3 - name: Set Up Java uses: actions/setup-java@v3 with: distribution: 'zulu' java-version: '17' </pre>

	<pre> - name: Install Apache POI Library run: mkdir lib curl -L https://repo1.maven.org/maven2/org/apache/poi/poi/5.2.3/poi- 5.2.3.jar -o lib/poi.jar curl -L https://repo1.maven.org/maven2/org/apache/poi/poi- ooxml/5.2.3/poi-ooxml-5.2.3.jar -o lib/poi-ooxml.jar - name: Compile Java Program run: javac -cp lib/poi.jar:lib/poi-ooxml.jar:. ExcelMonitor.java - name: Run Java Program run: java -cp lib/poi.jar:lib/poi-ooxml.jar:. ExcelMonitor </pre>															
15. Check the file structure in github.																
16. Now click on “Action” button in github browser.	 <table border="1"> <thead> <tr> <th>File</th> <th>Description</th> <th>Time</th> </tr> </thead> <tbody> <tr> <td>.github/workflows</td> <td>Create excel-monitor.yml</td> <td>now</td> </tr> <tr> <td>ExcelMonitor.java</td> <td>New Code Added</td> <td>14 minutes ago</td> </tr> <tr> <td>README.md</td> <td>Initial commit</td> <td>28 minutes ago</td> </tr> <tr> <td>ScienceFair.xlsx</td> <td>New Code Added</td> <td>14 minutes ago</td> </tr> </tbody> </table>	File	Description	Time	.github/workflows	Create excel-monitor.yml	now	ExcelMonitor.java	New Code Added	14 minutes ago	README.md	Initial commit	28 minutes ago	ScienceFair.xlsx	New Code Added	14 minutes ago
File	Description	Time

README.md	Initial commit	28 minutes ago														
ScienceFair.xlsx	New Code Added	14 minutes ago														

Module 9: Future Trends and Innovations in DevOps Practices

Exploring emerging trends in DevOps, including GitOps, NoOps, and AIOps:

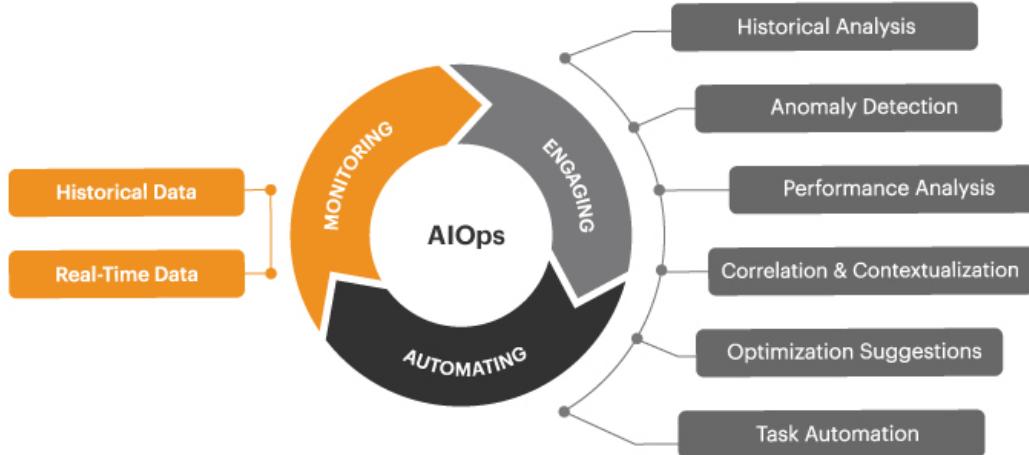

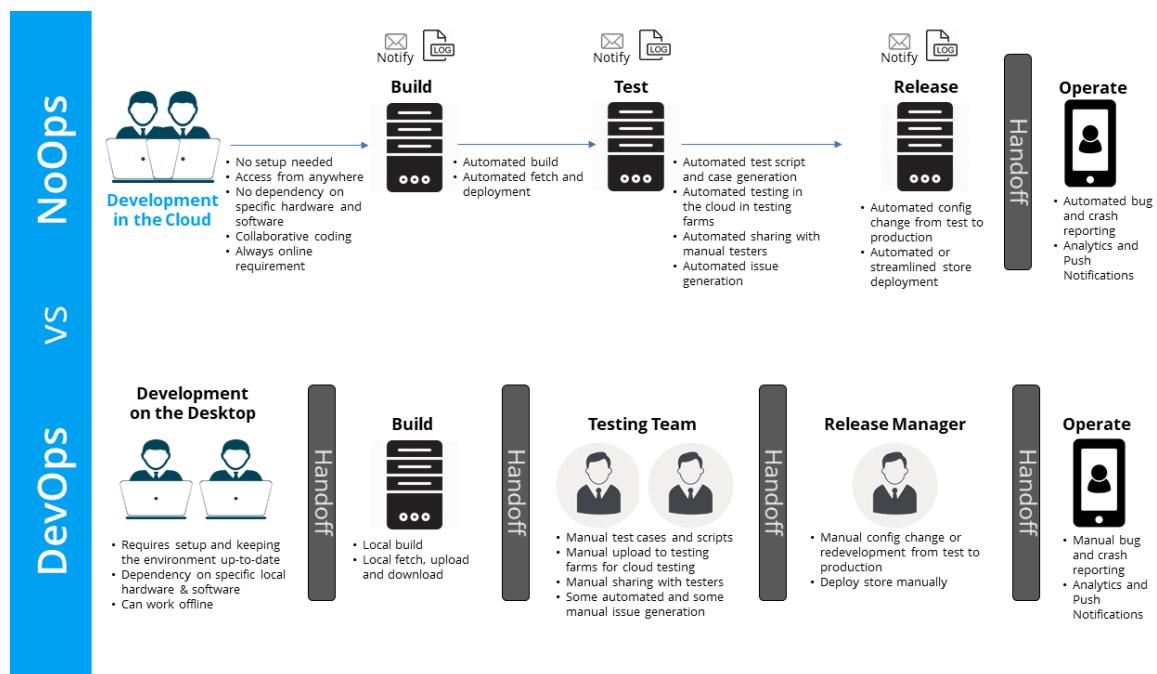

GitOps is a standardized approach to deploying, configuring, monitoring, updating, and managing infrastructure as code. GitOps keeps documentation, code, and any other information related to deployment in a version control system like Git, and makes updates automatically using automated directors.

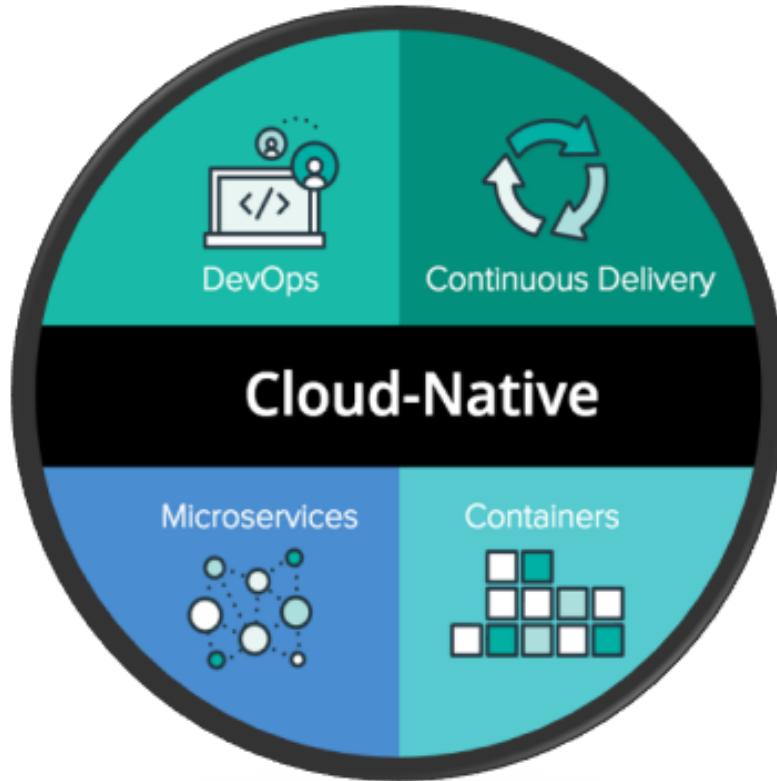

NoOps is the concept that operations can be completely automated, with zero need for software management. NoOps follows a trend that has been in development for over a decade now.

DevOps vs NoOps:

AIOps stands for artificial intelligence for IT operations. AIOps is a model that recognizes that advances in big data and machine learning are the keys to building new approaches in the rapidly evolving IT environment. The concept refers to a set of technologies that utilize analytics and machine learning (ML) to enhance and automate IT operations.

Recognizing the Influence of Cloud-Native Practices and AI in DevOps

- These applications are run and hosted in the cloud and are designed to capitalize on the inherent characteristics of a cloud computing software delivery model.
- Cloud-native applications use a microservice architecture. This architecture efficiently allocates resources to each service that the application uses, making the application flexible and adaptable to a cloud architecture.

Reflecting on the future prospects of DevOps practices.

How DevOps is Shaping the Future:

- 1. Building Things Faster:**
 - In the future, everything will happen quickly. Apps on phones, games, or even robots will get updates instantly. DevOps will make this possible by helping teams work faster.
- 2. Making Things Work Better:**
 - Imagine your favorite online game never crashes, and it always works perfectly. That's what DevOps aims to do for all kinds of technology.
- 3. Helping Solve Big Problems:**
 - With DevOps, scientists and engineers can create tools to fight diseases, protect the environment, and even explore space more efficiently.

4. Robots and AI:

- Robots and AI are like the super-smart helpers of the future. DevOps will make sure these helpers can learn and improve without any mistakes.

Fun Activities to Understand DevOps:

1. Lego City Challenge:

- Divide into two teams: one to build (developers) and one to check if everything works (operations). Work together to complete the city fast and without any wobbly parts.

2. Robot Race:

- Program a small robot (or pretend to) and make sure it can fix itself if it gets stuck. Talk about how teams make real robots smarter.

3. Future Inventions Game:

- o Imagine a new invention like a flying car or a talking treehouse. Discuss how DevOps could help make it real.

WITH OUR WEALTH OF INDUSTRY EXPERIENCE,
NTUC LEARNINGHUB PROVIDES HIGH-QUALITY
TRAINING PROGRAMMES THAT ARE INNOVATIVE,
CONTEMPORARY AND AFFORDABLE.

These consist of programmes in:

- **Infocomm Technology**
- **Employability & Literacy**
- **Business Excellence**
- **Human Resources**
- **Healthcare**
- **Security**
- **Workplace Security & Health**
- **Foreign Worker Training**
